From: jw94@davinci
Message-ID: <3h8fh3$32f@bright.ecs.soton.ac.uk>
Source record: 261716

Could someone in the U.S. tell me what the law is regarding sale and ownership of cellular capable scanners.
I have noticed a lot of postings about cellular restoration on the AR8000, specifically what I want to know is :-

If I as a U.K. citizen buy a UK model AR8000, can I sell it to an american citizen as a second hand product legally. If it is legal I was thinking about setting up a service selling "2nd hand" UK model AR8000's to US buyers looking for scanners without cellular lockout.

Thanks for any replies,
John Wigley

1864. Radio Shack vs. Uniden?

Newsgroup: rec.radio.scanner
Date: 1995-02-07 19:35:26 UTC

Source record: 261719

I am thinking of purchasing a handheld scanner. What is the popular concensus regarding which brand is better? (Radio Shack or Uniden) I am interested in the Uniden 2500XLT ? (the top line uniden handheld) and wonder if it is respected in the scanning arena?

I'm certainly interested! I own both the AR8000 and an HP100LX. I
think the two machines are perfect for each other. I've been wondering
if the Scan Star software would run on the LX.

Bryce

In article <CCARTEE.95Jan31230118@regal.cisco.com>,
Claude Alan Cartee writes:

Speaking of databases, does anyone use their AOR8000 with some sort of
palmtop? I've got an HP100LX, and it has a built-in database
application which seems to be a natural for compact on-the-go computer
control. As an aside, the low-power cmos cpu doesn't radiate as much
RF as the bigger laptop/desktop models do...

I'm working out a db now, so if there's enough interest, I'll post.

I've used this service and can attest to their service. Their only
problem is sucess! Last summer they were 3 - 4 weeks behind, so the
repair took a long time. Quality job at a fair price. Returned the
broken parts, too.

Any readers know the name of the airway on 134.9MHz, or where the
relevant aerial is?
I get it very strongly, and often hear the ground controllers.
It also gives an image 21.4MHz up, on 156.3MHz, namely marine Ch 6,
which is quite strange....conjures up visions of flying boats :-)

I have the Uk version of the AR8000 and also the CU8232 UK computer interface. I really think that an exact clone can easily be done. In fact on page 103 of the users manual for the 8000 it states the following:

There are three options for copy:

1. ALL-DATA: To duplicate an "exact" copy of one AR8000 with another. etc,etc.

2. SYS-DATA: To duplicate only the system data,,etc,etc.

3. BANK-DATA: To duplicate the Memory and Search banks.....etc.

I have yet to try this and I'm not even sure that it would be legal...any comments?

Thanks for the encouragement on the www page.
I guess it is time to follow up on this isn't it?
Here is the mail I received on the option decoder unit for the ar8000.
.....
Hello Vic,

your AR8000 homepage is great! I found lots of interesting things there.
Keep up the good work!

A few days ago i bought an AR8000 here in Germany from a company called
Bogerfunk. I really hate to buy from them but so far they are the only
shop which offers an AR8000 with build-in speech-inverter. I thought
they had developed it on their own but now i've just read the info from
tree@kla.com (AR8000 from Japan). It seems the speech-inverter is
available for the AR8000 as a standard option board.

The option board itself is (de)activated by holding down the LOCAL
button on power up, so there is definitely support for it in the
firmware. After this you can toggle the inverter on/off with the LOCAL
button. If it is on, an additional digit appears on the 3rd display
line. If you hold the LOCAL button down, the digit can be set with the
tuning knob to a value between 0 and F, so this is obviously a hex
digit. The speech-inverter board seems to use the lower two bits to
control the inversion frequency which is normally about 3kHz, so you get
four different pitch(?) settings.

The bad news is, this option is global. You can't assign the on/off state
to a specific channel or bank.

I only have the radio for a few days now but it seems it has lots of
birdies. It stops on many frequencies even if i connect a 50 ohm
terminator to the antenna socket. If you are interested in more comments
just drop me a line.

p.s.: this is not my native language and i have been flamed before for
bad english. If you want to use some of this text please correct any
spelling errors and funny wordings. ....

I just got another follow up from Dl5yec

Hello Vic,
i have a minor correction to my first mail: the optional digit shown
on the display appears not on the 3. but on the 4. display line in the
second column.

> Thanks for the info. Please see if the inverter board, by itself, can be
> bought as I would like to try it here in the USA. It could easily be sent by
> mail.

I'll try but i doubt it. Bogerfunk is so far the only dealer who offers
it, and then only if you buy the AR8000 from them. They put a special
sticker "Guarantee void is seal is broken" on each and every rig they
sell, and this *will* break if you try to open the scanner. So even if
you could buy the option board you are not allowed to install it.

73 de Django DL5YEC

.....
There you have it my 'secret' was the speech inverter.
It occurs to me that many police encryption devices are
basically speech inverters. This would allow you to decode them
I reckon.
Speech descramblers and such are illegal now to be offered for sale
to the us public. That is why you will never see one here in
normal chnanels.

.....
PS Funniest scan of the week. The K9 unit who lamented that when
he opened the door his dog got gone. I wonder how long he had been
riding around without letting it wet a fireplug? Later the female cop who reported
she had a woman who found his dog and she would put it in her car an take it
to the officer's apartment.

<chicken@imap1.asu.edu> wants to know:
>Hey I was wondering what type of reception I would obtain by installing
>my cable wire into my scanner. I mean, he helps bring out FM radio
>stations on my receiver, but can it help on the scanner?

No, not really. The FM reception is there because the cable company specifically puts that section of the spectrum on the cable. The TV channels are often remodulated (i.e. if you have a channel 6 broadcasting in your area and it is on channel 6 on your cable system, then it is being received, then retransmitted into the cable). Most importantly, though, is that cable channels 14+ (or A and up) are placed in the any spot on the spectrum that will (a) not interfere with other FM or TV stations and (b) reduce the bandwidth needed for the distribution network, so if you hook the cable to your scanner, you should be able to pick up some very distorted TV audio all across the spectrum.

>appreciated.
>
>
> -= Rich =-

CPU Blockout? Does that mean "truly" non-modifiable? i.e. cutting out
or replacing diodes will not restore "CPU blocked" frequency ranges?

I have a PRO-51 that is dated 8A4, and the keyboard mod works except for
channel 23 that is supposed to contain a frequency in the 869-896 Mhz.
The channel instead contains a different frequency.

Does anybody know of an internal modification to the PRO-51 or other
Radio Smack scanners that are dated post 7A4? I have noticed lots of
folks asking about the various models with more recent date codes, but
not much response. If anyone knows what's up about these newer beasts,
many people lurking in this group would greatly appreciate the help.

Thanks...

I am hearing nasty things about post 10A4 dates on *some* scanners - that they have a CPU blockout of some sort placed on them that renders them non-modifiable. I do not know first-hand if this is true, and I am trying to get more information from helpers here in this newsgroup. I would like to find out if the CPU blockout is real, and if *no* internal modification is possible at all. Also would like to know which date codes and models are affected. Anybody know???? Thanks in advance for anyones input...

You've got to be more specific in your "Radio Shack vs. Uniden" question.

Radio Shack sells scanners **MANUFACTURED** for them by two companies -
GRE and ... you guessed it .... Uniden.

1889. AOR 8000 Squelch Problem?

Newsgroup: rec.radio.scanner
Date: 1995-02-08 00:36:01 UTC
From: ccartee@regal.cisco.com
Message-ID: <CCARTEE.95Feb7163601@regal.cisco.com>
Source record: 261544

I am having some interesting 'problems' with the squelch on my
AOR8000. I have been using it to monitor public service (150Mhz,
450MHz NFM) and military aircraft (220 - 400 MHz AM). I notice that
even on a strong mil. air signal the sound seems to come in and out
like the squelch is on a threshold. It almost sounds like what you
get when you set up a priority channel and the scanner is off checking
that frequency (this is just for reference, as I have the priority
feature turned off.)

If I press the Monitor button on the side, the signal sounds solid.
If I lower the squelch, the signal is solid, but is soo low that the
scanner will break on noise on another channel. I also note that the
mil. air range seems to be very particular to receiver orientation.
(I'm using the rubber duckie that come with my BC-2500xlt).

I don't seem to have this problem in the public service bands. I'm
wondering if its something peculiar with the modularion, the frequency
range or the unit itself?

1895. Views/Reviews of PRO-62 wanted

Newsgroup: rec.radio.scanner
Date: 1995-02-08 01:05:43 UTC
From: jdjustin@netcom.com
Message-ID: <jdjustinD3nppJ.MwK@netcom.com>
Source record: 261551

In an attempt to remedy my past bad experiences with the BC 200 XLT, I have purchased a PRO-62 Scanner. It has none of the interference problems in the 480 Mhz region that the BC 200 XLT has.

However, I have noticed that it is not as sensitive as the 200 XLT is in the 160-170 Mhz range. In fact, when doing side by side comparisons, the 200 XLT clearly receives signals that don't even break the squelch of the PRO-62.

Has anyone used an external/outdoor antenna with the PRO-62? If so, have you had acceptable results? Also, how does the Pro-43 compare with the Pro-62?

1896. Views/Reviews wanted on Pro-2027

Newsgroup: rec.radio.scanner

One thing is that it has an exposed wire near the top on either the
left or right, that can touch the batteries. I forget which side it
is on, but you might take a look at that. It is definitely at the top
and is a silver-colored exposed wire. Caused all sorts of "battery"
problems for me.

Hi Jerry:

My company, PerCon Corp, has been the leader in FCC Databases on CDROM. PerCon is the official contractor for the FCC Master Frequency Database on CDROM.

We have the following products:

Spectrum - a Scanner Hobbiest Database- $29.95
US Index - Advanced hobbiest/ professional Frequency Database $79.95
Regional - Very Detailed Regional Frequency Database $99.95
Ham/Repeater - Ham Callsign Database w/ Open Repeater -Scheduled for March Release $19.95
Ham Callsign - Also For March $9.95 Per Quarter
Aircraft/Airmen/SDR -Database of all US Aircraft Registrations and Pilot Licenses- Also For March Release $49.95

And More !!!

I have the same problem with mine, I had not heard of anyone else with the
same problem. If I fully charge my 43 and do even turn it on, it will be
completely discharged in 3 days. Now I leave it plugged in on the power jack
if I am not going to use it, and the batteries seem to remain charged.

>pseudo SDU on the computer monitor?

That would be a function of the software (Scan*Star, Probe, Scancat etc.)
Since it is not using the IF output, the sweep rate is limited by the scan
rate (about 50 cps).

There is a group called phl.scanner, but it will be limited distribution. Much like the ba. groups in the San Francisco Bay Area. If you are too far away from Pennsylvania, it is very unlikely that your news site will have this group available. The discussions on the newsgroup are usually confined to Philly area scanner interests, since they also have rec.radio.scanner.

How about buying a second-hand black and white portable tv - you should be able to get one for £20 or so? Several years ago some of the Edgware Road electronic hobbyist stores were selling to tuners by themselves - you hooked the output into a VHF FM tuner. But seriously, the old tv set is probably the cheapest, if not the most compact solution.

Radio Shack scanners are made by both Uniden and GRE (General Research
Electronics).

>I am interested in the Uniden 2500XLT ? (the top line uniden
>handheld) and wonder if it is respected in the scanning arena?

I purchased the new Uniden/Bearcat BC3000XLT from The Ham Station after
thorough testing, and I recommend this model.

The BC3000XLT replaced the BC2500XLT and is more sophisticated.

: asset in the ar8000, email me for info...

Here is the hidden asset for anyone who is interested:
the good folks at
AOR have found a slick way around the cell- block in US versions of the
8000....cellular freqs can be heard loud and clear as images between
1419.9 and 1442.9 mhz. Since sensitivity falls off sharply above 1300mhz
on this unit, I can but surmise that this was an intentional design
feature.

I add my vote. I've recently gotten copies of a british scanner magazine called shortwave magazine and it is far superior to our monitoring times and pop com. The advertisements are also interesting because they show numerous scanners that we in the U.S. have never heard of. The magazine is sold on the racks at EEB and cost me two or three dollars each and i bought several back copies they had. Yes, a UK-Scanner group would be great. It might also open up opportunities to buy and/or trade units with UK scanner people.

I've recently stayed for a week in Ramada Inn in northern path of NY.
What a surprise: I can listen everything what's being spoken about
around tables in a restaurant/bar area! (I proudly owns Yupiteru MVT-7100).
Further listening uncovered, that:
1. Bugs are installed very close to (or in) tables and also in some service
room areas.
2. Bugs are powered from electric light source or similar.
3. Bugs are being turned on mostly on friday-sunday's evenings, when there
are lots of customers.
4. Bugs are transmits on frequencies range: 166 - 210 MHZ FM.
I've detected total 18 different transmitters, which is too much for a
small Inn hotel!

My friend told, that most likely Inn's management listening on their own
employees to avoid free drinks/food for their friends or so.
I'd guess that other Inns doing similar things.

I'm looking for freqs for the Dallas/Fort Worth/Denton area.... I'm a student at the University of North Texas and fairly new to the area...

1933. Where are the FAQs?

Newsgroup: rec.radio.scanner
Date: 1995-02-08 20:03:34 UTC
From: mmoore@tad.eds.com
Message-ID: <3hb82m$gsc@mloeff01.elec.mid.gmeds.com>
Source record: 261493

I have read several postings regarding tips, tricks and mods for various scanning devices. Could someone please direct me to the Faq, FTP or Web site that might contain these listings? I am specifically looking for tips and tricks related to BC200XLT.

Any assistance is greatly appreciated.

Thanks
Mike

1934. Re: AOR 8000 Squelch Problem?

Newsgroup: rec.radio.scanner

In article <CCARTEE.95Feb7163601@regal.cisco.com> ccartee@regal.cisco.com (Claude Alan Cartee) writes:
:I am having some interesting 'problems' with the squelch on my
:AOR8000. I have been using it to monitor public service (150Mhz,
:450MHz NFM) and military aircraft (220 - 400 MHz AM). I notice that
:even on a strong mil. air signal the sound seems to come in and out
:like the squelch is on a threshold. It almost sounds like what you
:get when you set up a priority channel and the scanner is off checking
:that frequency (this is just for reference, as I have the priority
:feature turned off.)
:
:If I press the Monitor button on the side, the signal sounds solid.
:If I lower the squelch, the signal is solid, but is soo low that the
:scanner will break on noise on another channel. I also note that the
:mil. air range seems to be very particular to receiver orientation.
:(I'm using the rubber duckie that come with my BC-2500xlt).
:
:I don't seem to have this problem in the public service bands. I'm
:wondering if its something peculiar with the modularion, the frequency
:range or the unit itself?

It isn't specific to your unit. All five AR8000's that I've listened to have this problem. The wider the signal, the more noticable the problem.

1935. BEARCAT 890XLT W/CELLULAR SALE

Newsgroup: rec.radio.scanner
Date: 1995-02-08 20:30:30 UTC
From: jaylgold@crl.com
Message-ID: <3hb9l6$b7u@crl5.crl.com>
Source record: 261497

I have a new Bearcat 890XLT scanner. Nice scanner, in box with manual
and tons of freqs for feds and other interesting freqs. Scans 100
channels per second, backlit display, weather alarm, tons of features,
too numerous to list.
I had the cellular mod done on the main board so it does scan
continuously through the cellular band. Works great. It will also scan
and automatically program your scanner as it recieves transmissions.

$300.00 firm and I pay the shipping.
Jay
Santa Rosa, CA.

p.s. I am selling this scanner because I receive a new handheld as a gift
and don't need 2 scanners. Scanner is mint (brand new).

>
> ~Ken

The Pro-43 uses EEPROM for memory so no battery current is used when off. Nicads loose 1% of their charge/day, could that be what you're experiencing? I've since switched to Rayovac RENEWAL rechargeable alkalines and have had EXCELLENT results. You won't be able to recharge them in the unit, you have to charge them in their own special charger, but it's well worth it. If you do switch to the RENEWALs, they claim full charge in 3-5 hours but I've found that full capacity is achieved in about 12 - 18 hoursm, although still useable after 3-5 hours.

Try them, you won't be dissappointed.

>concensus regarding which brand is better? (Radio Shack or
>Uniden) I am interested in the Uniden 2500XLT ? (the top line uniden
>handheld) and wonder if it is respected in the scanning arena?

If you want Uniden's latest/greatest, get the 3000XLT; it is the
upgrade from the 2500 and has supposedly improved the triple conversion
front end to be more interference free. Uniden seems to pack more
features for the buck in their units.

Richard McLachlan (Richard@foxfield.demon.co.uk) wrote:
: In article <3gteur$mvu@mrnews.mro.dec.com>
: klimasewski@fccvde.enet.dec.com "My name is Ken" writes:

: >
: > What are the performance differences between them? Is one any better
: > than the other receiving wise? I realize the computer interface is a plus
: > but what about the receiver?
: >
: Having played around extensively with both, I would go for the MVT7100 every
: time. -- The VHF/UHF performance of both is good and the SW performance
: marginal like all scanners, but the Yupiteru is very much more user friendly. A
: good test of any scanner is -can you use most of its' features without ever
: reading the manual. If you can, it is sensibly simple. The MVT7100 passes this
: test easily. The AOR doesn't.

: The Yupiteru also has the performance edge over the AOR, even though it is
: considerably cheaper here.

: Yupiteru manufacturing quality is excellent. AOR is not always so.

: In Europe, the MVT7100 outsells the AR8000 by a factor of 10 or so.

: Richard

I concur with Richard. I have both scanners and find that the
performance of the Yupiteru is much better. The Yupi performs much much
better on HF SSB. I was going to sell the Yupi when I got the AR8000 but
decided to keep the Yupi because it is a much better all around performer.

Frequency 134.900 MHz is used by the Dover Sector at the London Area and Terminal Control Centre at West Drayton. This sector handles the majority of Airways traffic over North Kent/South London above FL155. The transmitter sites are at Swingfield (5 miles West of Dover) and Warlingham (8 miles West of Biggin Hill) and are offset by minus and plus 5 KHz, respectively, to prevent hetro.

>ki4je

You are not correct. 470.3625MHz divided by 25KHz is a nice and even 18,814 with a .5 offset. Maybe it don't like the offset, but the other band comes out even. Cook County F1 155,595MHz divided by 15 KHz is 10373.0 and the AR8000 wouldn't take it untill I changed the step to 5KHz. Come to think of it, dividing 470.3625 by 5 still leaves a .5 offset, but the machine liked it just fine. Go figure.

What frequencies are these things on. They give you one when you give the number in your party.. they are small square white boxes that vibrate several pulses when they set it off. I'm pretty sure it's high band.

: I am considering the purchase of a Bearcat 2500XLT.
: I know it is advertised as going from 25MHz to 1300MHz,
: but can anyone tell me what the blackout bands are on this
: scanner?

Two ranges... Cellular 869-893 and 550-760. So it's "almost"
continuous coverage. I don't know how they can advertise that. The
battery life is terrible too because of the amount of amperage this thing
draws.

Can someone make a text file on the mods for the 855 XLT? My boss
keeps buggin' me to mod his, and the usual sites don't have the mods to
this scanner!

Thanks!

Dave

In 11 major metropolitan areas the frequencies for TV chs 14-20 (470 - 512 Mhz) are available for allocation for land mobile use, primarily by public safety agencies. The 'cell phone calls' you heard were probably calls patched from mobile units through their dispatch repeater system.

If you are finding a freq of 857.xxx in channel 23 instead of 888.960,
then do the following..
press 2-9-band, and turn the radio on. The whole display should go on.
While the display is on, hit 2-9-lockout...hold it a few seconds.
Release them, then check Channel 23...it should now say 888.960.
Good luck

From: dbaker@tiger.lsu.edu
Message-ID: <3hcn13$1c5h@tiger1.ocs.lsu.edu>
Source record: 261577

Our local cable operator has neglected to add NASA tv to it's
channel lineup during shuttle missions (something it has done for
sporting events in the past).But the bottom line is: I can't find
a way to watch NASA tv...
I understand (maybe not correctly) that , like the audio from HOUSTON
(which I AM able to get on the local HAM repeater), the VIDEO may
be retransmitted. I have seen text files on the subject that mention
rebroadcasts on channel 58 of a cable ready tv, as well as
one of the OSCAR sats repeating the signal.

My question is this: can someone clarify this for me?

If anyone can help me figure out if it's possible for me to pickup
the NASA tv signal from SOMEWHERE other than a cable company,
I'd certainly appreciate the help!

Dave

Do BR have a PMR system?
Many stations have a big thing, looks like an aerial, sort of a U shape on a big stick.
One guide suggests that they have a freq around 106, but obviously that is a bit awkward, right in the broadcast band.
Scanners 3 has another freq in the 68-88. but it always seems dead.

Consumer Credit Advocates, PC
11 Pennsylvania Plaza, Suite 2101
New York, NY 10001
(212) 629-5261 (telephone) (212) 629-4762 (fax)
E-MAIL: ccapc@cyber.sell.com

Our LAW FIRM offers direct guaranteed effective credit restoration services by experienced attorneys. THIS IS NOT A DO-IT-YOURSELF KIT.

What can we do?

We have successfully facilitated the removal of Late Payments, Charge-offs, Foreclosures, Repossessions, Collection Accounts, Loan Defaults, Tax Liens, Judgments and Bankruptcies from our clients' credit reports. WE GUARANTEE THAT YOUR CREDIT CAN BE RESTORED!!!

Who needs our services?

Anyone who has experienced the inconvenience and embarrassment of being turned down for a credit card, a lease or a purchase of an automobile.

Anyone who is unable to buy the house of their dreams due to denial of a mortgage application or who has to pay thousands of dollars more in mortgage interest than someone with good credit.

Anyone who has been turned down for a job or promotion due to derogatory credit items on a credit report.

Anyone in business who has lost a deal because a person or firm wanted to see his/her credit report before doing business.

Anyone who has been unable to establish credit.

THE FOUR GREAT MYTHS OF CREDIT:

Myth #1: It is illegal or immoral to have your credit report cleared.

Fact: It is not illegal nor immoral. In fact, that is what the Fair Credit Reporting Act is all about. The act was enacted by Congress in 1971. One of its purposes as to give consumers the protection of the law and to help guard against

any unwarranted invasion of a consumer's right to privacy.

Myth #2: The information on a credit report cannot be changed.

Fact: Actually, the opposite is true under the Fair Credit Reporting Act. Federal and State laws require that items be removed if they are not 100% accurate or cannot be verified in a timely manner.

Myth #3: It is impossible to get a bankruptcy off a credit report.

Fact: Bankruptcies can come off credit reports like any other derogatory item. The nature of the derogatory item has nothing to do with its removal under the Fair Credit Reporting Act.

Myth #4: Credit Reporting Agencies are empowered with some kind of governmental authority.

Fact: Absolutely Not!! They are simply large corporations whose primary goal is to make a profit like any other business.

If you have ever applied for or received credit, a file exists in one or more of the credit bureaus. These companies collect, store and distribute as much credit information as they can find, retaining negative information on a credit report for 7 to 10 years. This information is evaluated by potential creditors to determine your credit worthiness.

Credit reporting agencies are in business to protect the interests of the creditors. the LAW FIRM's goal is to help and protect the individual consumer from inaccurate credit reporting.

The president of our LAW FIRM has been practicing consumer law since 1984. The staff of our firm has successfully processed, disputed and challenged thousands of client credit reports.

Our legal fee is based o the number of negative items that appear on a client's credit reports, issued b the three national credit bureaus. Our retainer agreement offers a MONEY BACK GUARANTEE stating that if any negative item is not deleted, upgraded or corrected from a client's credit file, it will give the client a full refund for that item or continue to process the client's file at no additional fee until that item is

corrected, upgraded or deleted. THE ONLY THING YOU HAVE TO LOSE IS YOUR BAD CREDIT!!

PLEASE CONTACT THE LAW FIRM AND LEAVE YOUR FULL NAME, MAILING ADDRESS AND TELEPHONE NUMBER SO WE MAY FORWARD FURTHER INFORMATION AND INSTRUCTIONS TO YOU ABOUT OUR SERVICE.

Sorry, but I _don't_ vote for this. Fragmenting the group would mean some people might miss interesting/important info (eg Bob Parnass's reviews) that could be of interest to 'UK' readers too.

Also, some sites newsfeeds (mine included) don't get all the alt. groups. (ok ok I can hear some of you saying 'so what are you bothering about!?)

Matt

Grundig YB-500 - 1

I was looking at the Grundig Yacht Boy 500 recently because of its having RDS - I suspect that the RDS on the Satellit 700 is similar / identical. It has a diagnostic feature where you key something like 1-2-3-4-5 before switch on. It then will read various details of the RDS - like PI, TA, TP and also the RDS "quality".

But it does not use any of these features. It displays the PS - station name - but I am not sure if it uses the AF automatic retuning of RDS. It display the Travel News flags TA & TP in diagnostic but does not use it at all.

There is a clock on the radio but it is not updated from the RDS CT clock. Its a great pity that a bit more thought had not been put into the design. Incidentally this diagnostic function is present on some car radios, usually needs a series of key presses to get into the mode.

I ended up getting the new Sony RDS radio - its not a SW radio just VHF/MW/LW I was quite disappointed with the design of that also and wrote to Sony in Japan - they confirmed my suspicion that it was designed in Japan where they have no RDS !

It does update its clock from CT though. Also uses the TA/TP flags to allow you to get Travel News from another channel.

They do not have fully automatic returning using AF but you push a button to step through the various Alternative Frequencies.

I was most disappointed by its not fully using EON (Enhanced Other Networks), it has it so that it can retune to another station for Travel News. But I was hoping that I would be able to tune one memory to BBC Radio 2 in a new town and the other 4 memories would be loaded with the local frequencies for Radio 1, 3, 4 etc using EON. But it doesn't.

****

Sony 2010 - 3

I found it VERY easy to plug in and start listening. The supplied instructions are adequate for what they do, but
are not really enough to really start enjoying the radio. The whip antenna works great at home, but just doesn't cut it at work (way too much metal/interference). Even the supplied wire antenna does not seem to help at work (I have not yet tried it at home

(no real need).

****
Realistic DX-342 - 1

I've owned this little radio for about a year
now and am really pretty happy with it.

Advantages: Size - Measuring approximately
4 3/4 x 2 5/8 x 1, you can take this little
mini anywhere! Even slip it into your shirt
pocket!
SW bands - Covers 9 SW bands: 49m, 41m, 31m,
25m, 21m, 19m and 16m.
MW, FM, FM Stereo (thru headphones)
Travel Power lock
Push button control
Runs on two AA batteries or AC adapter
Travel pouch
Carrying strap

Disadvantages: It's an analog unit, guys and gals,
no digital display.
No back stand
Antenna does not rotate up

I've had a lot of fun with this little receiver. The
SW sensitivity is quite good for my area of the
country, Cleveland, Ohio. The speaker has a nice sound
and improves thru the earphones. FM stereo thru
headphones is great! MW DXing is surprisingly
good! I can grab signals from Boston, Chicago,
New York and Cincinnati much better than on my
Magnavox AE 3625 Digital!

Summary: A nice little travel radio that's fun
to fiddle with or take for travel when you're in
a pinch. Radio Shack has discontinued this model
so you might be able to find it on sale for around
$50.00. I love the size! Ideal for travel! I'm
beginning to think that anything larger is too
cumbersome. I do miss the Digital Display and all the
features that go with it: Freq. display, Alarms,
world time display, etc. If I were buying today, though,
I'd consider what else is out there for just a bit more
money. For example, the new Sangean 606 is only
slightly larger and has all the digital features mentioned above that I miss. I
've seen it priced for as little as
$179.95!

****
Realistic DX-350 - 1

I bought this radio when I first started out in shortwave listening because it was the cheapest thing at Radio Shack. I think I paid $60 for, but I'm pretty sure the price has gone down since then.

Nowadays I mostly use it as my travel radio. Sesnitivity is okay for the price, but not too great. When I'm at home (western US) I can pick up the major international broadcasters, but no too much else. On my trips back East, I've found sensitivity picks up some, but it's still only fair.

Performance on the AM and FM bands is average, but longwave seems to be nearly useless. I've never heard any nav beacons on this one, even though there are several near my house.

Radio Shack sells a reel antenna for about $8, and I picked one of these up when I bought my radio. It helps reception a little, but not very much. A much better solution is to wrap a stripped end of a wire around the the whip antenna, and attach the other end to a metal windowframe. I've tried connecting my longwire to it, but that just overloads the receiver (not surprising).

One major problem that I've noted is that the dial markings on some shortwave bands seem to be off by up to 10 kHz. If you know about it, it's not much of a problem to work around, but initially it could be quite confusing.

Overall, this receiver is average for its price. There's no real surprises, either good or bad. If you really want an inexpensive radio, go for this one. Otherwise, I would advise saving your money and going for an inexpensive digital radio.

****
Realistic DX-375 - 1

It costs $99.99 though I got it for $89 since I had a coupon for a rebate. For the price I think I got a good deal. It has digital tuning and direct input of frequencies which allows tuning to be a pretty simple job and not a time consuming act of patience. It uses two C type batteries... I use rechargable ones and they last a pretty long time..

It is not small enough to carry in your shirt pocket but it could fit in the front or side pocket of an average sized backpack. It is just great when you are walking back home from school/work ... it can be easily carried in one hand as you catch up on the news from BBC/Deutschewelle/Radio Australia/etc.... as you walk home..
I get decent reception of all the `big stations' even indoors and have, on occasion also been able to tune to Radio UAE....

The sleep function is perfect for someone like me who likes to fall asleep with music... the FM sound is pretty good in stereo (headphones)... The AM reception is also fairly good but it has a very high tendency to catch those Bible bashing stations...probably a reflection of the region where I live...

The strap is a little shoddy and I have a feeling I may have to `fix it'
soon... I expect it to pop out any moment....
Despite that, I like it...

****
Realistic DX-380 -2

I've owned a DX-380 for about 9 months now and....
It's a GREAT RADIO! However, I should qualify
this. I bought it on sale from Radio Shack for the
bargain price of $129.95! It regularly retails for
$179.95. At $130.00, this radio is a real steal!

About the size of a large paperback book, the 380
is feature packed!

*DUAL CLOCKS
*ALARM WITH RADIO/BUZZER
*60 MINUTE SLEEP TIMER
*DUAL BANDWIDTHS
*DIRECT FREQ. ENTRY TUNING
*TUNING KNOB
*SLEW TUNING
*TUNES IN 1 OR 5 KHZ STEPS
*CLOCK DISPLAYED SEPARATELY
*BACKSTAND
*STEREO THRU HEADPHONES
*CONTINUOUS SW COVERAGE...NO GAPS!
*AUTO SCAN UP OR DOWN
*ANTENNA ROTATES AND SWIVELS
*CARRYING CASE

The sensitivity of this radio is GREAT! With a reel antenna, it's even
better! I read another review that said reception was lousy....I think
that individual should check his particular receiver as he might have
the rare defective unit. MW reception is also outstanding and with a
Slect-A-Tenna is greatly improved! Herein Cleveland, I pick up
Chicago, Cincinnati, and Pittsburgh during the day WITHOUT the
select-a-tenna! With the S-A-T reception gets an added boost!
(these are all 50,000 watt stations)

I have found it to be about the perfect travel size. I would like
something smaller, like the 606. This size, however is fine. I've
carried hardbound books on jets that are larger. The many features
makes up for it's slightly larger size over a mini. It does not have
SSB, but I really don't miss it.

All in all, A great radio priced at $130.00! I would not have bought
it for the price of $179.95. There are other radios in that price
range that ive ya more bang for the buck. At $130.00, it's a great
deal! If you can get it at that price, snap it up!

I am by no means an expert, but I have a DX-380 and can give some
of my experiences. First of all, I would pay the extra to get the

390 to get the single side band capability. I miss it. I miss it. Also, the sensitivity for foreign broadcasts (I'm in DC) without an external antenna is poor. You get the BBC and some German broadcast relays from Canada transmitters, some south american stuff, and that's it. BUT with a 50 m Cu wire out my 2nd story window attached to the antenna with an alligator clip, I regularly get Abu Dhabi and Australia at night.

****
Realistic DX-390 - 2

Great mid-sized digital portable. Good sensitivity and selectivity. Digital display shows time, frequency, signal strength, and memory location. Covers LW (in 9 kHz steps), MW (in 9 or 10 kHz steps) and SW continuously from 150 kHz to 30000 kHz. FM reception (88-108 MHz) with stereo through headphone jack. BFO control for SSB reception. Built-in timer/clock, 9 programmable memory locations per band, except 18 on SW. Good audio output. RF Gain and AM bandwidth controls. Keypad frequency entry. External antenna, AC-adapter inputs.

A great radio for the beginner or as an upgrade from a smaller and/or analog unit.

Purchased from Radio Shack for $219 in January, 1992.

I have a new Realistic DX-390 (alias Sangean 813??). Seems to be a great value for the price $169 US. I haven't yet heard from someone who can recommend a radio for the same price that is better, and can back it up with facts.

****
Grundig Satellit 700 - 3

Truly a world-class portable, digital receiver. Excellent sensitivity and selectivity. Digital display with two separate clock/timers, signal strength meter, band selection, frequency readout, and user-definable eight-character "name" for each memorized station. Has RDS circuitry on FM to decode the newly-phased-in system for identifying stations by call letters, format, etc. 512 memory positions, upgradable to 2048. Tunes in .1 kHz increments. Selectable wide/narrow bandwidth for AM mode reception. Tunes MW in 9 or 10 kHz steps. Keypad frequency entry. Receives USB and LSB. Synchonous detector helps pick difficult-to-receive stations out of the crowd. Selectable automatic/manual gain control. Covers LW (150-353 kHz), MW (528-1611 kHz), SW (1612-30000 kHz), and FM (87.5-108 MHz). Excellent audio output, with separate treble and bass controls. Stereo through headphones or external speakers. Line-level out (left and right), external antenna, and 12 VDC-in jacks. Local/DX switch. Built extremely rugged. Multi-national power supply included.

An outstanding performer, and worth the price to a serious SWL or DX'er who requires portability.

Purchased from Universal Radio for $479 in April, 1993.

The Following is a comparison of the SONY ICF-SW77 and the GRUNDIG SATELLIT 700:

Both of the receivers you are looking at are pretty solid. The Sony is slightly smaller and has a somewhat more "finished" feel about it. The Grundig is SOLID with a much better sound. Neither is as good a SW signal receiver as the previous Sony, the '2010 (2001). However, they both have very advanced features; multiple (and in the Grundigs case, expandable) memories with alphanumeric tags so that you have a name as well as a frequency, all sorts of memory grouping and scanning etc. The Grundig has good RDS ident. on it's FM band, but I have a feeling that this isn't used much, if at all, in the US. If you intend to buy second-hand, be very wary of the SW77 - the early version was pretty flakey. The later version is better but still not as good as the '2010.
I think that the choice comes down to "feel". They are both quite complex to use, but both work as advertised. Try 'em both as they have quite distinct operational methods. If sheer performance on SW is the main point for you, compare them with the Sony ICF2010. You'll buy it and save some loot !
For what it's worth, I tried them both and settled on the Grundig. I have my Satellit 700 in daily use and it's performed without a hitch.

My reasons for the choice were:

1. Performance. The Grudig was much better than the early SW77.
2. Sound. I happen to prefer the slightly bassy Grundig sound to the somewhat sharper Sony.
3. Power. The Grundig takes D cells and can self-charge Nicads in the set, which is how I have it set up. (The SW77 used C cells) They both run down batteries fast. The Sony worse than the Grundig due to it's smaller cells.
4. RDS. I love it and the SW77 doesn't have it.
5. Feel. I like the, I don't know, Germanic solidity and sheer heft of the Satellit. A Satellit with a full load of 4AH Nicads can tip the scales at twice the weight of a SW77. Of course, if drop one on your foot the Sony would be the better bet ! I only use the Grudig about the house. I have a '2010 for the road.

I hope this splurge hasn't clouded the issue for you.

Editor's Note:
I have one of these radios and love it! I sent the following message to someone just after I bought it.

I just recently forked out $500 and bought a Grundig Satalit 700. The sound from the radio is truely impressive! I have always wondered why broadcasters put music on shortwave, because it alway sounded like garbage. However with the 700 I can listen and enjoy the music. The 700 has Bass and Treble controls, which improve the sound quality but the Automatic Gain Control most likely does the most toward improving the sound (I'm not an expert, so this is just a guess!). Anyway my Wife regularly listens to music coming from a 60m band radio station in Guatemala, and can enjoy the sound. However there are some bad points. It is programable, but I have not worked out how to do it yet. Well I tried once and gave up. This is not too bad though, because BBC, Deutche Welle, and about 10 others are stored in a ROM table. And these frequences actual work (i.e. they are the frequencies for North America and NOT Germany).
Also I connected a long wire antenna and found my local AM station on shortwave. I guess the front-end is not good enough to sort the signals out when coming from a large antenna. But don't worry about this either.
If you only want to listen to the biggies like BBC, Deutche Welle, you won't need an external antenna. I am planning to put a Pre-selector between The Radio and the Antenna, and I think this will cure the problem of AM stations on shortwave and cut out some interference. Finally I recommend this radio to you. I'm sure you will have hours if enjoyment from it.

****
Grundig Satellit 500 - 2

Formerly Grundig's flagship portable SW receiver, this is still an excellent piece of equipment. Excellent sensitivity and selectivity. Digital display with two separate clocks (only one displayed at a time), signal strength meter, frequency readout, and four-character user-definable "name" for each memorized station. 42 memory positions. Tunes to .1 kHz increments. Selectable wide/narrow bandwidth for AM mode reception. Tunes MW in 9 or 10 kHz steps. Keypad frequency entry. In addition to AM, has three receiving "modes" for LW, MW, and SW: USB, LSB, and "Sync," which should more accurately be described as "fine tuning," as this implementation of synchronous detection operates differently from the Satellit 700 or Sony 2010. Selectable automatic/manual gain control. Covers LW (150-353 kHz), MW (528-1611 kHz), SW (1612-30000 kHz), and FM (87.5-108 MHz).
Excellent audio output, with separate treble and bass controls. Stereo through headphones. Line-level out (mono), external antenna, and 12 VDC-in jacks. Local/DX switch.
Built extremely rugged. Power supply included.

An all-around great performer. Now that it's discontinued, many outlets are selling this unit at close-out prices, making

this radio an excellent value for the money.

Purchased from Universal Radio for $379 in December, 1992.

I have a Grundig Satellit 500 and am basically satisfied with it. I miss the 512 memories of 700 and 'SSB clarify' control sometimes.

Yes, its 'sync' is exactly fine tuning in 100 Hz steps. However, it is rather simple to make it work similarly to '700 and '2010, because the detector chip is the same in all three. Only a switch with two pairs of contacts is needed. Another design fault, the excessive distortion in SSB mode, can be partly cured by adding two resistors. For serious DX-ers it may be important that the internal ferrite rod cannot be disabled on MW and LW in both 500 and 700, so the in-house noise may become a problem on these bands.

****
Lowe HF-150 - 1

The Lowe HF-150 (sold by Universal and EEB) is a nice compromise. Similar number of cubic inches as the Sony (different shape), but offering some features of the R8. Also the Lowe is made with a mostly solid alumnum case, which is better than the Sony or the Drake. The Lowe has dual antenna inputs (wire or SO-239), record out, audio out, 12vDC in. It can run off any 12V DC battery. I use 7 aH gelcells which I recharge. The Lowe also takes 8 internal AA nicads *OR* disposable batteries. It will recharge the nicads with a builtin recharger if you plug it into an external power supply. It's a nice semi-portable radio. It has a few ideosyncracies, but you might want to look at it.

****
Lowe HF-225 - 2

I've had an HF-225 for a few years now, and I'm pretty happy with it. I use it mainly for broadcast listening. It's connected to 25m of random wire via a 5m coax run inside the house.

I tried using an ATU to improve the matching between the aerial and the coax, and on some frequencies it gave a (small) improvement in signal strength, but it was such a pain to keep retuning that I gave up using it.

I recently bought a "magnetic longwire balun", and this seems to offer the best of both worlds - improved matching between the wire and the coax, but no retuning necessary. It's rather expensive, though, and it may be that I'd have been just as well off with a home brew transformer on a ferrite ring...

The other potential advantage of an ATU, filtering out of strong signals well away from where you're listening, seems to be

completely irrelevant on the HF-225. I've never yet found a case where switching in the attenuator did anything beneficial. The receiver's front end seems to be excellent in this respect.

I've got the sychronous detector option, and I wouldn't be without it. It quite often makes a heavily fading signal quite pleasant to listen to. Pity it doesn't have a selectable sideband option, though - I quite often find myself tuning an AM signal in the LSB or USB modes to try to get rid of an adjacent interfering signal.

Would I buy it again? Yes, unless I decided that I really wanted a receiver which offered a computer interface.

****
Sony SW-1 - 2

I bought an SW1E over a year ago, for listening to broadcast SW and FM at home and while travelling. I like this very small radio a lot. It is maybe expensive for a portable, but the build quality is very good, - everything looks and feels right. Battery life is good, and the set DOES work with NiCads (2*AA) contrary to the instructions. Reception of broadcast SW is good, either with the whip or clothes-line antenna. I've never noticed any big problems from adjacent channels either. As a bonus, FM stereo reception is good through headphones. Audio quality from the in-built speaker is fair, but you'll want to use phones for noisy environments. The only bug with this radio is the memory capacity - only 10 mems is really not enough to cover ALL of AM and FM.
Summary - if you want a very small portable, and appreciate high quality (and can afford it), I would recommend the SW1E. Note the E, which denotes the SW1 kit without the active antenna and brief case - these add a lot to the price, and I don't rate the antenna too highly either.

****
Sony SW-15 - 1

I bought one of these puppies on impulse the other day (at my age you should give in to the occasional impulse, just so they keep coming). Cost $85; you could probably do better by shopping the discounters.

Specs:

Dual Conversion Receiver, 6 1/2 x 4 x 1 1/2 inches, 3 AA or 4.5v DC.

Nine Bands:

FM: 76-108 Mhz, 10.7 Mhz IF.

SW: 5.775 -6.425; 6.875-7.525; 9.375-10.025; 11.6.5-12.265; 15.00-15.65
17.50-18.15; 21.325-21.975. 1st IF 10.7 Mhz; 2nd IF 455 Khz.

MW: 530 - 1710 Khz; 455 Khz IF.

Analog Tuning dial, volume control, music/news tone switch, 7 position SW band selector. FM/MW/SW select buttons double as "on" switches. "Off" button. "Hold" button to disable "on" (prevents accidental turnons) Slide rule, multicolumn frequency display. Hand strap, foldout stand to hold at angle on table, soft carrying case. Basic shortwave guide. Telescoping antenna. FM/MW/SW "on" and tuning LEDs. Mono earphone jack.

Subjective Review:

I'm pretty impressed. Sensitivity is up there with the Pomtrex [:-)] without the "splatter" of strong stations. Analog tuning dial requires a delicate touch but for me that's part of the fun. Drift seems nonexistent; you get a station and it keeps it without a lot of vernier twiddling. MW performance was surprisingly good, as was FM. I'd recommend it as a starter radio.

****
Sony ICF-5100 - 1

I bought this radio in Kuala Lumpur in 1988, and I'm not sure if it goes by the same model number in other parts of the world. It is a shirt pocket analog tuned radio with coverage from 6MZ to about 21MZ in seven bands. The radio is very rugged and has served me well despite of the physical abuse it has gone through. Because of its small size the speaker is only small and the sound from it it a little tinny, but I used it mainly to receive news in countries without English language news services and in remote areas while camping etc. I recommend this radio to anyone, who considers size the most important factor. Cost was about US$70.

****
Sony ICF-7601 - 2

In some respects this is my favorite radio. No bells no whistles no FM stereo -- just a good solid (feels like a small brick) analogue unit. It covers AM, FM and has 10 SW bands that cover most of the "out of band" frequencies. Band switching on SW is done by a slide on the front of the radio while buttons are used to switch from AM to FM to SW. The dial is accurate to 5 kHz so is very easy to locate a station. I believe that it was simply the best low cost analogue rig out there. It's still around and can be had for well under $100.00. Grab it!!

I have a 7601 also. Most of its weight is from the batteries and the speaker, giving it better tone and volume than smaller, lighter sets.

As with other cheap analog sets, it wasn't very hot out of the box.

If you "super tweek" the 7601, it's pretty good on AM, but no match for a 2010 or Superradio III. Most of the shortwave bands peaked up well, but I never could get 19 meters working right. As with most analog portables, the whip is part of the RF tuned circuit, so one must be careful to duplicate the exact listening conditions when tweeking the radio. Even the presence of headphones will shift the antenna tuning.

Unfortunately the 7601 picks up FM stations at various places on the shortwave bands. If you're far enough away from FM and TV stations you might have room for an R-390.

When going on trips I usually take my SW-1 because of the convenience of the presets and the reception flexibility provided by the active antenna that comes with it.

****
Sony ICF-SW33 - 1

I've owned this radio (SW33) for about 9 months and use it as my "carrying around the house rig." It was purchased to replace a Sony 7601 that now resides on my desk at college (things electronic can grow legs on a college campus). By far the best features of this unit are its convenient size and excellent performance on all bands, AM, SW and FM stereo. Don't get me wrong -- this is not a DX machine on SW but for listening to the major broadcasters, it's excellent.

The single filter selection seems just about right and tuning on SW is in 1 kHz intervals. This at least gives you a "fighting chance" to move away from interference. That's a major improvement over the 5 kHz that many radios in this price range allow. In addition, the dual conversion design on SW keeps image interference at bay - a major plus for a small portable.

The radio does not have a keypad so entering frequencies is a bit clumsy. However, by entering the middle frequency of each of the major SW bands in the 7 memories (5 memories plus 2 timer memories) and slewing up or down from those positions you can get around reasonability fast. The SW bands are changed by a combination of 2 keystrokes.

The sleep control (shuts the radio off after 1 hour) can let you be lulled to sleep and the timer alarm can make sure that you get to work on time (radio shuts down after 2 hours if it is turned on by the timer). Setting the radio alarm is very easy - once you have set the clock, but that frankly, is a pain. The clock function, which works very well (combination world/home time), takes at least 7 distinct steps to set it. Fortunately the clock is fairly accurate (looses about 0.2 sec/day) so you don't have to reset it very often. The lighted dial (stays on for 20 sec at the touch of a button) is a nice touch.

Battery life is excellent contrary to the 1994 Passport to World Band Radio (see below). The radio has a battery "gauge" that is

activated at the touch of a button radio and shows in the display as a battery icon with 3, 2, 1 or 0 dots inside of the battery outline. It disappears after about 5 seconds. As soon as the number of dots reaches 0, the radio shuts off immediately. I ran a a series of tests with Radio Shacks Super Alkaline batteries and got the following results: 3 dots showed for 37 hours, then 2 dots showed for an additional 11 hours, and finally 1 dot showed for 3.0 hours for a total of 51 hours. (Radio ran 1.5 to 2.5 hours/day with the volume control set at 1/2 volume most of the time). At $2.89 (plus 5% for tax) for a package of four AA batteries (the radio takes 3), that figures out to 4.5 cents/hour which is excellent. This figure differs greatly from that given in the 1994 Passport (25-30 cents/hour). I have no explaination for the difference but I stand by my test values.

Would I recommend this radio to anyone? If you do a lot of band-scanning, forget it; it will drive you crazy. But at about $140.00 plus shipping (NYC mail-order) it's an excellent "second" radio to carry around for listening to the major broadcasters. I like it!

****
Realistic DX-440 - 2

I have a DX-440 and I think it is a good 'dabble' radio but if I ever get serious I will look for a > $500 table model.

I love this radio! It's my main radio and I use it exclusively at home, moving it from room to room. It really is too large for travel

I've found the sensitivity to be tremendous on SW, MW and FM! Very rarely do I need to attach a clothsline antenna! It has continuous SW coverage, a great sounding speaker, BASS and Treble controls, two bandwidths, great sensitivity, good spurious signal rejection...It has all the features I wanted in a starter radio! I bought it about three years ago on sale for $150.00! I still don't know why Radio Shack discontinued it. If you're looking for a good starter shortwave radio and can still find one laying about at a Radio Shack store priced to move, GRAB IT!

****
DAK DMR-3000 - 1

I bought this radio since they have a 30-day money back guarantee and I did not know if I would like the hobby or the radio. Good points: direct-entry tuning, 36 station memories, fairly small so it is easy to travel with, speaker sound was good, reception was okay, but improved dramatically with the addition of the Radio Shack 23' rollup longwire ($8.95). Bad points: only 5kHz tuning steps, only major broadcast bands tunable (large gaps between bands), selectivity not so good, no fine tuning, no BFO, no SSB

or CW, poor FM reception. All in all, not a bad radio of $69.90, however, it left me wanting for more, so I got rid of it.

I have seen a couple of posts asking for a low cost SW receivers. I have recently bought a DAK Model DMR-3000, for just $69.90+$6.00 shipping from DAK - a mail order company.
The receiver has a direct access, so you can type in the desired frequency, and a manual / automatic scanning system. It also has a dual time clock with alarm and 'sleep' timer. Unfortunately you can tune only to the commercial frequencies on SW, AM and FM bands. I have to say though that cheapness comes at a price. The first receiver I got was defective so I had to ship it back and ask for a replacement. Now, I received a new one which works very well.

Compared to my Sony ICF-7601 the DAK unit is an insensitive brick. The fancy clock and timer features aren't really worth it. About the only thing nice is the FM Stereo support if you plug in headphones but the FM sensitivity leaves much to be desired as well.
Something else to watch for.... That pretty lettering on the buttons will wear off REAL fast. If you haven't used it much yet you won't see a wear off REAL fast. If you haven't used it much yet you won't see a problem. After you've done some tuning you'll see the pretty arrows disappear from the buttons.

****
Sangean ATS-803A - 1

Since I was now turned on by SWL'ing, I moved up to what most people agree is the best all-around radio for this price. Good points: excellent frequency band coverage (150kHz to 30mHz), fine tuning, good selectivity, BFO for SSB and CW, many scanning options, lots of accessories included, good AM and FM reception. Bad points: way too big to travel with, high battery consumption, synthesizer noise in background all the time, scanning frequently skipped lots of "listenable" stations that I was able to get by manual tuning (what's the use in scanning, then?). I found that adding a longwire antenna only increased interference and noise while not improving the set's scanning sensitivity. Overall, a fairly good radio for the price...

I have a Sangean ATS803A which I love. Comments to quote me on would be that it's an excellent beginner's radio for the price. Although I've heard that the 818 is the "latest and greatest" in this price/performance category. I especially love the full coverage 150kc-30mhz and the (albeit lo tech bfo) SSB capability.

****
Sony ICF-SW20 - 1

I was in dispair when I could not find a decent travel portable
for under $200. However, I accidentally crossed paths with a
Sony ICF-SW20 on sale (normally $99, on sale for $49.99) at a
local store and had to check it out. It is an analogue set, but
since I got a 30-day return policy on it, what the heck? Good
points: analogue tuning so no problem with confining 5kHz
tuning steps, INCREDIBLE SENSITIVITY - this radio blew the DAK
and Sangean away with the number of stations I picked up, good
selectivity (no fine tuning knob - all you need to do is turn
the tuning knob slowly), tiny size (4"w x 3"t x 1"d), small
whip antenna (only 18"), addition of Radio Shack rollup
longwire increased sensitivity even more, great low price (if I
lose it or its gets destroyed, no problem replacing it), tuning
bands are wider than the major broadcast bands, so you do get
some utilitiy reception as well as WWV, AM and FM are really
sensitive while FM goes from 76mHz to 108mHz so I can pick up
some TV as well. Bad points: frequencies cover only seven
broadcast bands (I can live with that, though), only monaural
earphone included (however, you can get a $1.39 mono to stereo
headphone plug), no BFO for SSB or CW, no station memories. All
in all, this radio gave me the best price/features/size ratio
of the ones I checked out first-hand. It's a keeper for me!

****
Magnavox 3625 - 1

Finally received my Magnavox 3625! Well, I'm certainly happy I
purchased this little radio. Sure, it's not top shelf, but it's
suitable for travel purposes and gives adequate SW coverage.

Has these features:
Travel Lock
Alarm (beeps, does not turn on radio)
Sleep Timer
9/10 KHz switch - for world travel
12 hour clock (however, when unit is swith to 9 KHz steps 24 hour
clock kicks in)
20 presets - 5 for each band FM, AM, SW1, SW2
Dual time
Auto store - this feature allows the radio to automatically find
the five strongest stations in an area and program
them into the memory of the FM & AM band.
Back stand
Antenna swivels and rotates
Runs on four AA batteries.

Well, the sensitivity is quite good. Steps in 1 KHz increments.
No tuning knob but the slew tuning buttons work just fine. It's
about the size of a paperback book and can be taken anywhere
reasonably well. No carrying strap,
though. The SW coverage is limited but it grabs the major
broadcasters exceptionally well. Example: the 41 meter band is

covered from 7100 to 7300. So if you want to listen to the BBC on 7325, you're oput of luck.

However, I like to listen to the BBC on 12095 or 15070 European signals during the day that I cangrab when I attach a long wire. The 3625 can't tune these freqs. but it can grab 15400 (from africa) WITHOUT a long wire antenna! I'm pretty impressed.

Bottom line....A GREAT little travel radio for $70.00! Call a Magnavox outlet if you are interested.

****
Magnavox AE-3805 - 2

Great little digital portable. Good sensitivity, average selectivity. Covers MW (in 10 kHz steps only), FM (no stereo), and SW in two "bands": 3200-7300 kHz and 9500-21750 kHz. Built-in timer/clock (12 hour format only), 5 programmable memory locations per band. Great for travel use.

Purchased from Damark for $49 in May, 1993.

$50 from Damark closeout -- cheapie category

****
Emerson PSW-4010 - 1

Great analog portable. Good sensitivity and selectivity. Covers MW, FM (stereo through headphones), and SW in 8 bands (roughly split out as 13m, 16m, 19m, 25m, 31m, 41m, 49m, and 60/75/90/120m). An excellent travel portable.
This is the same radio as the Sangean SG-789.

Purchased from DAK for $49 in June, 1988.

****
Sony ICF-5900W - 1

Sony ICF-5900W was a good radio in its day, but isn't worth listing now.

****
Icom IC-R70 - 1

I purchased my R70 in early 1983. It came with a scratched plastic window for the digital display, which the factory replaced. It is an extremely sensitive receiver. I installed the FM detector board option, which is highly useful for Sub-Carrier detection from FM broadcast receivers in conjuction with the R70's ability to tune below 100khz without a frequency convertor. The so-called PassBand Tuning (PBT), in actuality an asymmetrical bandwidth narrowing control, is very mediocre with the factory 455khz filters. Replacing the 455Khz ceramic SSB filter with a Fox-Tango FT-44 2.4khz 8-pole crystal filter (equivolent to the ICOM FL-44) makes the passband

filter work as one would want. The AM 455Khz ceramic filter is junk,
and was replaced with a higher quality "4Khz" ceramic filter from
the long-defunct Radio Plus firm. The actual specs for the 4Khz filter
indicate that it is a slightly asymmetrical filter of 5.6Khz bandwidth,
causing a slight degredation of the "highs" (The original spec is
for a 6Khz bandwidth; the 9Mhz AM filter is a 6-pole device). Inclusion
of both replacement 455Khz filters results in a combined shape factor
of much better than 2:1 on AM or SSB. In addition, the RF amplifier
was enabled for AM broadcast band use, and an MOV was placed across
the AC input for protection against voltage transients. [Actually,
a Transorb would be far better in defending against narrow transients.]
For awhile, I replaced the diode AM detector with a Shottkey diode,
but my ears could detect no difference in distortion, and so the
original AM diode was returned to the circuitry. It's been serviced
once by ICOM for an intermittant problem ($150 ouch). There exists
several modifications to enable selection of the 455Khz SSB filter
whilst in AM mode for additional selectivity.

Drake SPR-4 - 1

****
Icom R-71A - 2

Eskab & Edvis of Sweden used to offer a Phase-Locked AM (PLAM) detector for
the R-70 and later R-71; they also offer a version for the NRD525. I have
the R71 version. It is a synchronous detector which allows selection of USB
or LSB via the IF filter/BFO offset. The PLAM board phase-locks one of the
R71 local oscillators (I forget which one, probably the BFO) to the AM
carrier. It contains its own product detector. The lock range is not very
large, perhaps +/- 20 Hz. The detector seems to have lower distortion than
the ICOM AM detector.

Compared to ECSSB, aside from the advantages of phase-locking the product
detector BFO, the PLAM unit also lowers the corner-frequency of ICOM's
low-pass audio filter, giving better bass response than normal SSB mode on
the R71. I find that this improves the intelligibility of the signal.

The PLAM board piggybacks in the mounting area for the ICOM FM option
board; both can coexist. Installation is somewhat difficult, as it involves
connecting over a dozen wires to various boards in the R71.

Eskab & Edvis also offered a 4 KHz 2nd IF crystal filter for the R71. This
installs fairly easily in place of the narrow CW filter. It is very much
better than the stock ICOM 6 kHz bandwidth, which is wide-open until it
hits at cheap ceramic filter in the 3rd (455 kHz) IF.

I don't know if Eskab & Edvis still offer the R-71 PLAM and 4 kHz filter.
They used to advertise in the WRTH.

Regarding other options: I believe Sherwood Engineering offers an outboard
synchronous detector for the R71 as well as other receivers. The Kiwa MAP
unit should also be adaptable to the R71.

Also, Dom Moman of Shortwave Horizons publishes a modification manual,
which details mods like enabling the preamp on MW, true pass-band tuning,
sub-10 Hz RIT, etc.

****
Kenwood R-2000 - 1

****
Kenwood R-5000 - 1

****
Kenwood TS-450-1

I know it's not a reciever, but since it has general coverage,I decided to
put it in here.The TS-450S is an amateur transciever that costs little more than
a R-5000,and if you have your ham ticket or are thinking about getting it,may
be worth checking out if you are in the market for a new toy.I'd be willing
to bet the replacement for the 5000 will look just like the 450,just like the
5000 looks like the 450's predacessor,the TS440S.First thing it is EXACTLY
the same size as the 5000/440.Unlike the 5000/440,it has an LCD display that
is unlike any other I've ever seen.It is almost too bright!The brightness
cannot be adjusted,unfortunatly.The 450 recieves in all the standard modes
except for fax.It has a"normal"keypad unlike the 5000 and the aggravating
CW that is produce when a major button is pressed can be silenced by y
-a simple menuss,you dont have to cut a wire like the 5000he S-Meter
is a bar-graph type that I like but some people dont.It also has an Audio
meter function that kin baffles me.I still dont know what use it is,but it
looks nice!Probably the most notable thing you will observe when using the
450 is the QUIET!It is so quiet,it seems strange the first couple of times you
use it.The AGC is non-defeatable and has a fast/slow toggle.It is the strangest
and slowest AGC I've ever seen,on slow the S-Meter just sits there and then
SLOWLY goes down.On fast,it just isn't quite so slow.It seems to work ok,but is
really odd.The stock filter for AM is a mile wide but you can add the YK88 AM
filter but you wll lose the open slot for the 8.83 ssb filter.I'm not sure,but
the 450 seems to have the same stock am filter the 5000 has.On SSB,it uses one
of the better Murata ceramic filters and is ok but the optional SSB filters are
highly recommended.The audio is FANTASTIC on all modes and if you put one of
the minimus speakers from Radio Shack on it,you will like it a lot.Dont bother
with the Kenwood speakers,the one that goes with the 450 is not too good and is
expensive too!The ergonomics are pretty good,except for the tuning knob,yes
like all the recent vintage Kenwood rigs,IT DOESN'T HAVE A FINGER HOLE!!Why
does Kenwood insist on putting these awful knobs on all the rigs they have made
lately!All in all,it is a very good riever in almost all respects,and since t
it only costs about $100 more than a 5000,it is worth a lookND as a bonus,
the recieve coverage goes up to 40 mhz!If you are into low band scanning,you
will hear things on the 450 you never knew existed on your scanner.If you can

swing the 450's sister model the TS690,you can recieve all the way to 60 mhz. When the 5000 is put out to pasture,if it's replacement is the 450 without the transmitter,it will be very tough competition for the other makes.All it needs is Sync.detection and you really couldn't ask for much more.

****
Japan Radio Company NRD-515

THE all time most user-friendly recieveof recent vintagHas PBT,analog fine tune,four I.F.bandwiths,AM,LSB,USB,and RTTY modes.There is no squelch but it really doesnt matter much.Of all the recievers I have owned,or ad over here to play with,it is the most sensitive in the SSB modeI have the standard 6 and 2.4 khz filters,and th600 and 300 hz filters whitch are great for RTTY or CW(if you are truly desparate!)The "protection"diodes have been removed due to intermod from a local AM station.The reciever's case,front and back panels are made of Aluminum,no plastic to crack on the 515!The audio in AM is very bad,almost as bad as the Icom R-71a,but in a different way.The audio is "fuzzy"out of the speaker jack,but not too bad out of the record jack but still a little "fuzzy".In the SSB modes,the audio is pretty clear and doesn't fatigue me like the Icom dos far as thergonomics goes,it's almost prefect!All the knobs are the right size,the tuning knob is large and has a nice deep finger hole(Kenwood,are you listening???).The S-meter is big and easily seen across the room.Dynamic range is very good after the diodes have been clipped(a one minute operation).The filters all are good quality and have good shape factors.This was the first "affordable"rig that had a memory option that was worth something with 24 or 96 channels available. The NDH-518 I have(96 ch.)is also made totally out of cast and sheet aluminum and matches the 515's styling.It stores frequency only,unfortunatly, due to the year it was designeIm guessing.There are lots of these recievers floating around on the used market for about $600 or so.Universal seems to have a lot of them passing thrgh the store.

****
Japan Radio Company NRD-525 - 1

This is a great reciever,marred only by bad audio and a hiss that will drive you bonkers if you have good hearing and a speaker that can put out the highs. I have had two of these,the first I traded for a sateite setup,and the one I have now.The newer reciever has mucbetter audio then the first one and lesess hiss too.Ergonomics are very good MUCH,MUCH better than the Drake R-8.(IMHO,the Drake is seriously overrated and all the stuff about made in the U.S.A.is kind of funny cause a LOT of the innards are MADE IN JAPAN!!!)Oh well,back to the 525,if you are into AM,it's probably not the reciever for you, but in allthe other modes,it is one of the best consumer grade recievers ever made.Performance in all modes is basically excellent except fothe audio pr problem,and stability is rock solid.JRC has only cut a few corners compared to the 515,probably the ultimate in construction for consumer recievers. The case is made of very thin sheet metal and the front panel is plastic.The keys fit loose in the keypad but work ok.The display has four brightness levels and is very easily read from across the room.The S-Meter is "digital" and is a floating vertical bar segment that seems to be yellow on some samples,

and green on some others.It is sort of "spastic"and twitched a lot on the
first one I had,but not as much on the seconone.The first 525 I had would
"click" on strong AM signals,but the new one doesn't.The main tuning knob
spins very smoothly and has a nice finger hole.(KENWOOD,WHY DONT YOU LISTEN!!)
All in all, a great reciever.

****
Japan Radio Company NRD-535D - 2

I have been using a NRD-535 for two years and i am very pleased
with it. Although the relative high price makes this a radio
for the serious DXer and maybe not the average Shortwave listener.

The NRD-535 has very good ergonomics. It is very easy to operate
during long listening passes. It has 200 memory channels which comes
in handy for storing interesting frequencies that you want to
check later, or stations that you want to check regulary.

+ side:
On the plus side there is the BWC and the very good sensitivity.
The BWC combined with the PBT makes it possible to make
a station readable that is very close to another station, or
a interfering RTTY transmitter. I find that i mostly uses
the SSB mode and zero tunes the station, and then uses the
BWC and PBT to get the most readable signal. The BWC and
PBT has saved a lot of reports for me. The sensitivity
is excelent. It is among the best in this price class.

- side:
The audio in the built in speaker is mediocre to put it mildly.
A station that you read loud and clear in the earphones can be
inaudible in the built in speaker. The selectivity is not as
good as it could be. The NRD is very sensitive for splatter from
nearby stations, and this can totally drown the station that you
want to listen to. The ECSS option that you can equip your NRD with
is a joke. I have it installed but i NEVER uses it. The only time
you can use the ECSS with any improvement of the signal, is if the
received signal is strong to begin with. Don't waste your money on
the ECSS.

The conclusion is that the NRD-535 is a very good receiver for the
serious DXer but it has some shortcomings. The 535 is much better
than the Icom R-70 that i had before, and i would recommend it to
anyone that asked me. What you might want to do is change the filters
to somewhat sharper filters. That goes for both the 9 MHz and the
455 kHz filters.

****
Yaesu FRG-100 - 1

****
Panasonic RFB-65L - 2

$220 from Universal, EEB, etc. -- my main set, an excellent
portable, many features, nice construction and details.

****
Sony SW-55 - 2

This is my principal radio at the present time (I also have the
Sony ICF-SW33 and the Sony 7601). This rig is an extremely
sophisticated piece of equipment. I especially like the fact
that you can store up to 125 frequencies on 25 electronic pages
that can be named as you wish (by country). Once programed this
is very convenient. The two filter selections are well chosen
(much better than the stock Sony 2010 filters). My use the radio
to copy WEFAX with excellent results attests to its stability
(and that it receives USB and LSB).

The versatile timer/alarm and tape remote feature allow
automatic recording with certain tape recorders (Sony and others)
of up to five times and frequencies in a 24 hour period. I use
this feature all of the time. Audio (stereo on FM) qualitity for
a portable is very good; better I believe than the stock 2010
although as with the 2010, it is improved with a set of external
speakers.

Unlike the 2010, the SW55 does not have synchronous detection.
That's too bad because I believe that if it had this feature it
would blow away
tition. As it stands it is an excellent radio. Most
interference can be eliminated with the narrow filter or moving
away from the interference a bit (the radio is tunable in steps
of 0.1 kHz) so the lack of sd is not critical. I really
believe that Sony did not include it because it would have then
had a very negative impact on sales of the SW77.

Would I buy this radio again. You bet! The only problem I've had
in the year an
owned it is that the lettering has worn off the 1, 5, 0 and EXE
keys on the keypad. That should not happen on a $300.00 radio!

I just got a SW-55 for Christmas and find it to be an outstanding radio. Now
that I've said that, you should know that I am new to all of this "DX-ing" (is
that how you say it?). However, I can tell you that it's reception with the
built-in antenna and with the included auxiliary antenna is very good. I found
that the radio comes pre-programmed with a number of stations (BBC, Radio
Moscow, etc.) and they come in great.

As for your questions, I've found the speaker in the SW-55 to be very high
quality, delivering plenty of volume and good sound. There are several "tone"
switches (news vs. music setting, etc.) that enhance the reception and its
sound. And, the unit is packaged well for travel.

The radio itself has several nice features (I don't know how they compare to
other radios since I didn't comparison shop). There are several output jacks
that make it easy to connect to external speakers, tape recorders, headphones,

etc. There are local/long distance antenna settings. There are lots of ways to set and look at the time (local, UTC, Daylight savings, etc.) There are alarms and sleep settings (for on the road).

The tuning portion is quite nice. The radio of course offers digital tuning (punching numbers in to get to a freq.). But I find that I often use the "analog" tuning dial as well to either fine tune a station or to see what else is out there.

Best of all, the unit is packaged well. As a new user, I have enjoyed the little things Sony has done to make this experience a good one for the new user. Everything from the documentation to the carrying case has made it quick and easy for me to start listening to short wave. Included is a book that is a publishing of all the various countries broadcasting, with their freqs and times. (I gather that these things change quite a bit, but I presume that Sony updates it often)

****
Philips AE3905 - 1

In short, in my experience, the AE3905 is no real great shakes. It looks neat as hell, and marks its owner as a man of taste and distinction with more money than brains (like I said, *I* have one). Its shortwave performance is mediocre. Using this in a hotel last February, I found that attaching the included reel antenna caused the radio to overload fairly badly. The batteries don't last very long. The filters included are fair, but you still get a fair amount of interference from adjacent stations (not as bad as some small portables, but not good). I certainly wouldn't want to use this as my primary radio. For portability, it's fantastic. I can listen to the BBC or VoA anywhere. The radio fits in my shirt pocket, although reception in my pocket isn't all that good. In short, the radio isn't worth what Philips charges for it, but if you've got more money than you know what to do with and a desire to have a flashy looking toy, it'll do. The radio has only recently been available in small quantities in the U.S., and appears to have been discontinued in Europe. I got a reconditioned copy for $179 from the Magnavox factory outlet in Kentucky. Universal lists the radio in their catalog for something like $250 new if I recall correctly. You're not likely to find it anywhere else.

****
WATKINS-JOHNSON HF-1000 HF RECEIVER

I will be doing a lot of comparisons to my other receiver, an NRD-525. To give a basis for comparison, the NRD-525 has been upgraded by the following modifications:

ESKA PLAM board with four added filters following the IF strip
Installation of ESKA Aux filter in the NRD Aux position
Installation of the JRC 1.8 KHz filter in the Narrow position

Replacement of RF chokes on the filter board with shielded units
ESKA agc modification

These modifications have improved the shape factor on the NRD's filters from an average of 2.0:1 to 1.7:1 (60:6 dB). The ultimate rejection has improved from about -60 dB to -75 dB. These modifications are noticeable in on the air listening tests. The NRD hiss has been removed.

About two months ago, I bought another receiver, a Watkins-Johnson HF-1000. I didn't really think this receiver would be much better than the NRD, and I intended to return it if this was the case. I was wrong. The Watkins-Johnson receiver is clearly superior to the NRD in on the air listening tests, almost in every case. In rare cases it is a tie. The comparisons are done using an A/B switch that switches both the RF and audio lines so that comparisons can be made quickly on the same signal. Comparisons were all done in ECSS mode with the receiver settings made as close as possible to each other.

I also did some bench testing of both receivers, and the numbers that the tests give are not all that much different for both receivers, with the exception of filter shape factor. The HF-1000 shape factors run about 1.1:1 (60:6 dB). This does not explain the main difference between the comparisons, however. The HF-1000 seems to be superior in pulling out weak signals. I have heard many signals that are muddled and hard to understand on the NRD-525 sound sharp and clear on the HF-1000. Several other points:

AGC: The digitally processed AGC on the HF-1000 is far superior to the analog AGC on the NRD, even with the ESKA kit installed.
Notch filter: Again, the digital IF notch filter is superior.
Audio: The NRD audio has always sounded low frequency and mushy; audio on the HF-1000 is crisp and clear. This is an important item.
Operating: I like the controls on the HF-1000. They are flexible, yet easy to use. The set is a pleasure to operate.
Synthesizer spikes: The NRD has a synthesizer spike every 100 KHz. While these are not all that strong, some of them fall on inconvenient frequencies, like the propagation beacons on 14100 KHz. There are a few spikes on the HF-1000 at even 2 MHz points.

The only shortcomings in the HF-1000 I've noticed are the lack of synchronous detection (this is supposed to be sent out as an upgrade chip later), and IF passband tuning would be useful in the SSB modes. It is present in CW.

As you have probably guessed, I'm real happy with this receiver. I think it will be the last one I will have to buy for quite a while.

Watkins-Johnson HF-1000 Review Part 2

Watkins-Johnson SAM option for HF-1000

Recently I received the firmware for installing Synchronous AM (SAM) detection in my HF-1000 receiver. I was able to install it in about 1/2 hour and it worked great. In testing it I compared it to the

ESKA phase lock AM board installed in my NRD-525. Here are the results
for strong and weak signals:

Parameter ESKA+NRD HF-1000+SAM
--------- -------- -----------
Weak signal lock range +- 20 Hz +-250 Hz
Strong sig lock range +- 40 Hz +-900 Hz

As an on-the-air test I tried to lock onto Radio Pyongyang, 13760 KHz at
1300 UTC. The signal was weak and fading rapidly at 1300 UTC and was being
broadcast on 13760.1 KHz. The HF-1000 was able to lock it immediately even
when set to 13760.000. NRD was not able to lock it at all, even when set to
13760.1. Impressive!

Another modification in the new firmware is a change in the AGC function.
It is now possible to set three decay rates from the front panel for each
AGC setting, Fast, Medium and Slow. In addition it is possible to allow
the manual gain setting to control the AGC threshold while in AGC mode.
This is a great help for the AGC control. I spent many hours trying to
get the AGC decay rates correct on my NRD receiver, and was never happy
with that AGC. This required pulling out the IF board, replacing some of
the SMDs, putting it all back together, and then trying it. Digital AGC
processing on the HF-1000 makes this a snap, taking only a few seconds.

After several months of using this new mode of reception, it is the one
I nearly always use for SWLing and DXing. For weak AM signals it is hard
to beat. If the signal is readable at all, it will be able to lock on it.
By using both sidebands, you end up with a better signal to noise ratio
than with only one sideband. The HF-1000 is even more impressive now
with this addition. The only times that I have had to resort to ECSS on
AM signals is when there is interference on one sideband. Watkins-Johnson
reports that they will have single sideband SAM in the future which will
get around this. There are several other options that they are working on,
one of which is a plug in board for PC processing. I assume this will have
real time spectrum analysis and memory functions built in.

****
AR3000 - 1

My general impression, is that this is anyhow a very good apparate. It
offers continuous coverage 0.1 : 2036 Mhz, all mode, RS232 interfacing,
quite good operating commands, triple conversion, 400 memories; it is
very compact (small tabletop, 1.2 Kg.), semi-portable; its 13 auto-selected
front-end band filters reduce to some extent unavoidable intermodulation. In
general, this set offers a self contained and very well balanced compromise
of a lot of different demanding features, but will show its best when fully
interfaced.

Its price, here in Italy, has been varying greatly during the years.
Therefore I cannot say how it really competes with the choice of HF
receiver + scanner setup. It is still unclear to me how far is the AR3000
from dedicated traffic receivers.

I'm finding a number of defects and "whish it was" that I'm going
to list (I would like to hear comments about), but perhaps I'm
just pretending too much from a receiver in which something had
to be traded off between versatility and performance. Please note
that I have a 4 years old AR3000; some defects could have been amelio-
rated in the 3000A, or may eventually be specific of my unit.

Hardware limits:

-AM selectivity is mediocre (approx 10 khz bandwidth). I feel the lack
of a variable Am bandwidth. SWL in crowded bands is too often spoiled by
the 5Khz whistle. Thinking it was a problem of i.f. detuning, I once
sent it to the service to have it retuned, but with no perceivable gain.

-In AM I do experience blocking. A strong transmitter mutes any weaker adjacent
signal lying some -+30 khz apart. I suspect this may be rather a problem
of AGC voltage (see below on squelch), because the feedback signal is
obtained from the previous to the last i.f. stage, which may have a larger
than necessary (for AM) bandwidth.

-The squelch control (essential in search mode) is not very functional.
On my set almost everything passes for knob positions below .3 and
only >S6 passes when I increase to .5. It may be a problem of adjustment,
but also reflect the inaccurate behaviour of the S-meter, which (I have
no measurements to support) seems not properly logarithmic. I have
the impression that weak signals give a high S readout when close to
stronger ones, because the S-meter averages on a larger bandwidth than
the demodulator.
Also, the squelch just mutes the a.f. output, but not the line out signal.

-The internal speaker fidelity is scarce. No tone controls exist. Clarity
improves a lot when connected to an external speaker or lineout. No
noise reduction circuitry is present. External audio equalization does
a lot, but of course is not the cure for low selectivity.

-There is no i.f. direct output for say a spectrum analyzer or a different
demodulator (say wide band AM for satellite or TV, stereo FM decoder,
sinchro SB AM decoder). A modify could be to buffer it to a backpanel
jack.

-Intermodulation IS present. I live very close to power MW transmitter,
and in the times they're on the whole band .5 : 2.5 Mhz is unusable,
with crosstalk on every possible combination of transmitter frequencies.
At evening I sometimes hear sw bc stations crosstalks on 20 : 30 Mhz, even
with a short random wire antenna. However, I don't hear crosstalk due
to FM transmitters, which are also close to my place. The 13 front
end filters seem to do their job, since strong signals don't cause
crosstalk out of their respective preselector bands.

-I'm not very satisfied with the small and clicking rotary tuning control. In
the AR3000a it has been replaced with a (I guess optically encoded) smooth
one. I would rather appreciate a jog-shuttle like the one on VCRs, and the mod
itself seems quite easy too.

The tuning is however digital, and stepping frequency causes clicks, which eventually trigger the squelch threshold during search. The final a.f. is briefly muted while stepping, but I prefer the line-out signal which is unaffected and thus has a faster response.

-There is a single antenna input for the entire range. I think this however is correct, because whichever choice on different antennas is entirely dependent on the user setup, and should be rather left to an externally programmed antenna switch.

-Some digital RFI is generated, expecially in the high HF and low VHF. A real antenna connected with a shielded cable and a good earth however wash it out.

-Some small change in sensivity and background noise can be perceived when passing across one of the 13 band boundaries (by the way, they are 0.1-0.5, 0.5-2.5, 2.5-10, 10-30, 30-50, 50-108, 108-136, 136-174, 174-224, 224-335, 335-500, 500-940, 940-2036 Mhz), but this is unavoidable, and also due to the change of the superetherodyne scheme.

Software limitations:

-Scanning is already very versatile for such a small machine. However, auto memory storage of catched frequencies was forgotten. Also, the oddities in the S-metering (see above) impose manual choice when scanning non regularly channellized bands.

-There is a priority channel lookup feature, but the attention threshold has to be the current squelch position. Apparently (see
//ftp.funet.fi/pub/dx/receivers/mods/aor300.mod) in
the 3000a a programmable lookup time was implemented, but it is not present on the 3000.

-The mode and the tuning step change are set with several keystrokes. I feel it quite tricky, expecially considering that I generally have to switch quickly between 50 Hz/SSB, 500Hz/Am, 1.25 Khz/nfm, 50 Khz/WFM. The step x10 command is very useful, but not enough.

Since the S-meter signal is output on the RS232, and the unit may be fully remotely commanded, all this limits can be cleverly threspassed by an external control software, thought.

I have experienced problems with the 232 interface. The cpu goes crazy very easily when the connector is plugged in/out, unless the "remote" switch on pin 7 is previously operated. This is (I understand) the reason why it was added on the 3000a. When the cpu goes on the moon, one generally has to open the set and to push the reset button (backside of the keyboard), losing all the memories
.
Also, I cannot interface the scanner with an Atari St, either because the TTL level Txdata is to low for that serial port or because the continuous output of the S-meter simply is too fast for the Atari bios.
Passing by, note that the RS232 speed can be set to 9600 baud with a switch on the cpu board.

Sam, I bought an adapter cord that splits the output of the regular radio
antenna, one lead going to the car radio and the other to the scanner.
It works fine. Price about $15. Check it out.....

Last week I proposed ALT.RADIO.SCANNER.UK

There has been quite a lot of interest in this group, not only
from the UK but from the US and other locations.

It's about time we had a group of our own !

Thanks for the support so far.

Paul.

I got a scanner antenna from RS that looks like a cellular phone antenna.
It works just fine, much better than the rubber-ducky antenna did from inside
my truck. It costs $30 and it's permenant, you stick it to the window.

Are there any amateur radio repeaters or commercial services
which retransmit Space Shuttle audio in or near Chicago,
Illinois?

Rich Weinkauf's ``Space Shuttle Radio Frequency List'' [*1]
reports shuttle audio retransmissions from 2-meter ham repeaters
in Chicago and Downers Grove on 145.210 MHz and 145.350 MHz,
respectively. However, I haven't heard any shuttle audio on
either frequency.

Thanks.

: it has already been answered for television cable, so what about hooking
: up the ground in the house to a scanner's antenna? I'm always seeing
: little devices that you can plug into the wall that claims to use
: the electrical wires to pick up television better (as a huge antenna I
: guess) so could the same be done for scanners?

Depends what else is using that ground.

Grounding *everything* together at a common point is often
recommended for lightning protection. Idea is that if you
have a strike you will prevent the lighting from jumping
between different conductors, creating a lot of damage.

But, if you want to hear radio signals, the ground can
actually couple noise from one device to another. This
can seriously degrade reception. Thus, for best reception,
you want a separate ground, even though this conflicts with
what you want for lightning protection.

> I'm looking for an external scanner antenna for my car, but don't want a
> big fat magnet based object on top of my sports car.

Radio Shack has a scanner antenna that looks like a cell phone
antenna and attaches to one of your car windows. I had one but it
kept falling off. I think the best antenna is one of those magnet
mounts or one that is attached to the vehicle with the load in the
middle. They appear to pick up better. A magnet mount might suit
your needs as you can take it off when you want.

Source record: 261595

I have found the speakes in the Uniden portable scanners to
generally be larger than those in the RS models and, therefore,
easier to hear , especially in high ambient situations.

However, I have also found it difficult to purchase replacement
rechargable batteries for my Uniden scanner. Apparently they
are not commonly available through retailers and have to be
mail ordered from Uniden. Frustrating, indeed, when your
battery pack dies and you want a new one NOW.

Hi

> I have a scanner and live in Stockport, Cheshire.

> I get taxi's but only the base. Dose anybody know of
> any mobile freq's
Most taxi firms operate on high band frequencies and the usual seperation is 5.5Mhz.So your base frequencies are around 170Mhz mobile will be -5.5.
The 87/77Mhz as you can see is 10Mhz seperation,and normal low band is around 12.5Mhz.
Hope this helps

Steve

1990. Pro-44 modifiable?

Newsgroup: rec.radio.scanner

Source record: 261597

My Brother received a Netset/RS Pro-44 today for his birthday and is interested to see if he can modify it all, specifically for the 800+ freqs.

I have a Pro-43 that I modified which he really likes but his family got him this one.

On the back it says it's a Netset Mod 2-304 Pro 44. It has a DOC/MDC number of 255B253 and a serial number starting with C00.

That's about it.. can anybody offer any assistance/information?

I checked a number of ftp sites but couldn't find this model.

Private email or news replies would be much appreciated.

Thanks.

Barry

I think the TV band is somewhere near there here in the US, but I have another idea what it might be. I am thinking that it is an image of a ham station on 449.90 or somewhere thereabouts, since ham stations in the US are allowed to "broadcast" the audio from NASA Select TV, which is semi-live coverage of the shuttle missions.

I need to know if any one has purchased a cdrom that has streets counties etc.
I need one that has longitude and latitude on it.
I want to use it in conjuction with the long. and lat.
data I get from the PerCon Cdrom as to TX locations.

I would love to give the program two long and two lat coordinates
and get a map of everything in between.
Is there anything that meets this requirement?

I stoped at Sam's Club and saw three cdroms
$36 Deloran Travel Planner
$39 Ran McNalley Cdrom and travel Atlas
$59 Deloran (spelling?) Streets of USA.

Will any of these do the job?
Has any one bought one of these and care to comment about
it?

I have a HP DJ550C to print any maps out in color.

I want to map the areas I program into the AR8000.

Thanks if you can help me with this query.

There should be a lot of things you can use. What about:

J-pole
dipole
off-center-fed dipole

Bill Cheek has a few good ideas about scanner antennas
in his book "Scanner Modifications" (BTW, does anyone
know if vol. 3 is out, and if so, have you read it?).
He uses 300 ohm TV ant wire and a Radio Shack 300->75
Ohm matching transformer.

2011. Pro 46 Mod PROBLEMS

Newsgroup: rec.radio.scanner
Date: 1995-02-10 03:51:37 UTC
From: ATVMAN@ix.netcom.com
Message-ID: <3hens9$rte@ixnews3.ix.netcom.com>
Source record: 261621

Hi-

I introduced two friends to scanning recently. They hunted around and found two PRO 46 scanners that were supposedly modifiable. I obtained the Monitoring Times mod for them (remove 2 surface mount jumpers and add another one). After performing the mod and re-initializing the radio, entry of the desired frequencies still resulted in ERROR on the display.

This scanner did not exactly match the mod sheet. The lower "jumper" was actually marked "800" instead of "0". And one of the two blank pads that the other jumper was to be installed between had a blue wire soldered to it.

As a matter of fact, there was some sort of piggback circuit board glued to the scanner circuit board. It was connected by about six colored wires to various solder points on the scanner board.

I think that if thes extra wires were "normal", the mod would have mentioned the blue one.

Has anyone here modified a PRO 46, and if so, does this description fit yours? Did the mod work? Does anyone know another mod? And is it possible that there were some "unmodifiable" PRO 46's made later?

Thanks for your help

Ralph Fowler

As far as I know (I only have one :) the ranges ar 25-550 and 760-1300 minus cell (these are from memory, but probably very close). The couple of minor problems that I have noticed are that this scanner is a bit subject to intermod, although it doesn't bug me much, and that you can't choose mode for the band that you're in, i.e. if they say NFM, you're stuck with NFM. But the bands that are set are pretty accurate. (read I haven't found any times that it doesn't work for a known signal.) Oh, a tip for those that already have it, you can put all of the frequencies that are birdies/dead carriers in bank 20 and when you do a Search Store, the unit won't store those frequencies again.

Message-ID: <3hf0n4$sa9@quartz.ucs.ualberta.ca>
Source record: 261429

I just got a Realistic Pro-42 for Christmas. Unfortunatly it is probably one of the cheapest scanners a person can buy! It only scanns between 30-54, 138-174, and 380-512 MHz. I am trying to scanning the local airport here in Edmonton, but their frequency is 109.5, a frequency that my scanner cannot pickup. I looked for mods in many places, including oakland, NASA, and Archie but cannot even find my model listed. Is there anyone out there who knows how to modify this scanner to receive 109.5 MHz, or where to find a FAQ on how to do it, or know of a different scanner that this one may be simmular to? Here are some details; 10 channel direct entry programmable scanner, UHF-VHF Hi-Lo, MOD 20-302, Made in Canada, Doc No. 255 B106, Serail C001595.

Any help would be most apreciative.

Thank-you,
Darcey.

We recently evaluated a product that will create maps
down to the major street level anywhere in the US. It
will also read records containing lat/lon data from a
DBF file (or SQL database) and display them on the
maps created. All of this can be printed. The cost
of the program was around $450 (unless you are a
student). It is called Atlas GIS for Windows.

: normal chnanels.

Well, call Ramsey Electronics and you can have one in a couple of days (they sell them assembled or as kits, your choice, and are in the U.S. of A.)

It's more that there are not many of them available publically, as the law does not stop those who are doing. BTW, I fully support those opposed to this law.

On the same vain, I could order them in from Ramsey and resell them if I wished as well. They are real neat - you have the choice of unamplified descrambling or amplified descrambling - usable with tape recorder *and* speaker to monitor. Works well with the better cordless phones that are non-900 mhz!

I am looking for a listing of addresses and recommendations for publications aimed at the scanner hobbyist. I currently subscribe to Monitoring Times and Popular Communications but would like something a bit more advanced.

Harvey Park Radio, Box 621136, Littleton CO, 80162, (303) 231-6585
BC890xlt 249.95, cell mod 30.00, 20.00 off w/coupon, 8.00 shipping
Total: $267.95
But don't jump on Jay, he wants to get a good price for a good scanner and I'm sure he's willing to talk. After all, Rat Shack has this scanner, w/o mods, for 319.99!
Now about that cell mod for the 890xlt, anyone have the how-to details?

Thanks!!!

..Mike

Gary,

The R.S. H.T.'s use akaline batteries and are therefore
available eveywhere. Agreed Uniden batteries are harder to come by.

2036. Bel 645 STI Radar Detector

Newsgroup: rec.radio.scanner
Date: 1995-02-10 17:18:27 UTC
From: retzer@alpha2.csd.uwm.edu
Message-ID: <3hg753$o6b@uwm.edu>
Source record: 261449

I was wondering if anyone could give me some info on the Bel 645 STI radar detector. It has all the features I would like to have but is a bit pricey ($329.00 at a local electronics outlet). Is there a mailorder place that carries this type of item, possibly at discount prices? I've also noticed a detector from Radio Shack which has the same features (not to mention the fact that it looks exactly like the Bel) as the Bel. Its item 22-1653 on page 164 of the 1995 catalog. The only difference I can note is the price (the RS detector sells for $269.99. Is this a Bel Detector with the RS logo on it?

Any Advice would be appreciated,

Many Thanks,

Joe Retzer

2039. AR8000 birdie?

Newsgroup: rec.radio.scanner
Date: 1995-02-10 17:30:24 UTC
From: march@tudor.com
Message-ID: <MARCH.95Feb10123024@bonehead.tudor.com>
Source record: 261379

First of, let me make sure I'm using the correct term. I've found a frequency that continously shows a signal even if the antenna is disconnected. Furthermore, if I have my BC200XLT tuned to that same frequency there is no signal until I turn on the AR8000. Is this called a "birdie"?

Regardless of what it's called, could someone with an AR8000 verify that they get the same thing as I do? (If not, is the radio bad?)

The frequency is:

161.28 NFM mode

This is, of course, right where I want to listen.

Actually, as I'm typing this, I'm playing with the scanner. I can give you a range to check:

161.277 -> 161.285

and

161.263 -> 161.272

These two ranges show a strong signal even with no antenna attached. Any help would be appreciated.

Thanks!

greg

The cheap ones are in the 27 MHz range. There are a few freqs in the
high-band for paging and probably low-power stuff could be anywhere.
Check the Police Call book in the back for freqs listed as IB paging.

What you both heard was the cell site xmit fundamental osc. This is common if you are near a site, and listening on a television set, which does make a pretty cheap rcvr. Remember, a TV's IF is pretty wide, and will pick up a lot of individual 5k dev voice channels and spurs etc. You may also be hearing trunked interconnects in the 900 band. Mobiles xmit on 896 range. You might also try tuning channels 70 to 83 on the TV for more trunking and cellular.

2046. PRO-51 internal mod??? was Re: Eureka!!! PRO-51...

>WHOA, Wait a minute i missed the previous message, how is it done to the
>pro-51 ? and what exactly is being done to the pro-51
>
>/-/ighlander

You need a date code of 7A4 or earlier on the PRO-51 in order for the keyboard mod that restores cellular to work. Turn the scanner off, then press and hold 2,9,L/OUT, turn scanner on. This places the PRO-51 into test mode. In channel 23, you should see a frequency that is in between 869-896Mhz. From there you can direct search up or down to find additional frequencies and store them in memory channels.

Does anybody know of an internal mod that can be made to PRO-51 models that have a later date code? I have a 8A4 code, and the keyboard mod does not restore 869-896Mhz. Any help is greatly appreciated.

DeLORME has a CDROM now available that will do what you need utilizing Lat/Long. It is called MAPEXPERT version 2.0 for Windows. Excellent product. The 'retail' cost is a bit steep though at $195. But I is by far the best thing out there without a doubt.

I have two of the other products you listed above and they DO NOT utilize Lat/Long although they are otherwise excellent products. DeLORME is the leading edge for mapping. If you would like further specifics on the new MAPEXPERT, drop me e-mail.

I believe you heard cellular transmission on your TV-band radio. I say this because I have heard full duplex "domestic" conversations on my analog tuning TV. The transmissions shifted to different frequencies after short periods of time, and usually the volume of one party was much lower than the other, like most cell calls. The frequency shifts were so quick that I was never able to verify the primary frequency using a scanner.

The TV happened to be tuned to an unused UHF channel at the time (possibly channel 83, the UHF knob was broken). I was "watching" this channel by accident. Honest! :-)

Can you elaborate on these pagers? What are they used for?

Service staff at some buffet restaurants wear headsets to tell the kitchen people when to bring out more food. Are the pagers given to the customers so they can ring the kitchen for more food at their table? I think that would be a good idea. 8-)

Message-ID: <3hh4qt$e4r@nntp.crl.com>
Source record: 261473

Boy talk about beating a dead horse. Now that this information has been brought to my attention I am willing to sell my scanner for $265.00 and that is as low as I can go because I paid for the mod so I am going to lose $20.00. Are you happy now?

In all seriousness that is my price $265.00 w/cellular mod done (was not by tech in shop) so if it is too much, I guess you won't buy it.

Offer still stands, in box w/manual.

Jay

>Vic Healey Ki4je

Hi, Vic! I hae the DeLorme MapExpert and it is terrific. You
can enter a lat, long, and it will take the center of the map
right to it. Shows amazing detail of maps, rivers, even
railroads. Get this one - I enjoy mine!

If you have any questions, drop me a line and I will be glad to
answer them.

To All,

I have the Pro-62 and a Glass Mount and Roof Antenna for mobile use.
The best I can decribe the reception is a Choppy. Like continuous burts of
signal. I have played with the squelch to no avail. When the car is stationary
things are a little better . When the engine is off things are measurably better.

The condition is almost unbearable. Any suggestions would be
appreciated and worth a try.

Thanks, Frank

>I get it very strongly, and often hear the ground controllers.
>It also gives an image 21.4MHz up, on 156.3MHz, namely marine Ch 6,
>which is quite strange....conjures up visions of flying boats :-)
>
Can't remember off-hand which airway, but I'll look it up and email
it to you. That frequency is just one of the many used by LATCC at
West Drayton, but the relays are sited in various locations, and
LATCC and the CAA are generally rather reticent about revealing
any relay frequency/location combination details. You could always
try DFing it. Your image is a usual one, 10.7MHz being a common IF.
If you could email me your location, I'll see what I can find.

Alternatively, you could beg, borrow or steal (or buy) a copy of The
VHF/UHF Airband Guide, recently updated. If you mail
info@javiaton.demon.co.uk, I'm sure Jonathon will be more than
happy to tell you more about it.

Regards,
Julian.

>fairly handy mobile scanner. Does anybody have any experience with it?

The BCT-7 is an odd scanner -- better suited for sale at
truck stops than by dealers catering to scanner hobbyists.

It is oriented around a Service Search feature of preprogrammed
frequencies. Although you can program other frequencies,
it's very cumbersome to use as a general purpose unit.
You can search but only between very broad limits -- i.e.,
you cannot set your own search limits.

When select a state, the BCT-7 will scan frequencies
it "thinks" are relevant to your area. Every 2 seconds,
it samples frequencies used by state police mobiles.
Upon hearing activity on those frequencies a loud alarm sounds
and a bright red WARNING light flashes. Hmmm...what law
abiding hobbyist would use a device which warns of
nearby police officers? :-)

The BCT-7 I had on loan was an early unit (sale sample #1, really)
and had image problems, including cellular phone images despoiling
the 800 MHz band.

Ive been following this thread for a bit an Im afraid some of you are under a misconception. Its is NOT illegal to sell a cellular capable scanner here in the U.S. It is illegal to IMPORT or MANUFACTURE them anymore, here in the U.S. You may buy NEW cellular capable equipment only you are with a govt agency that is authorized, that is buying new equipment made here in the states or imported from overseas from a manufacturer or retailer. Private individuals may sell ANY cellular moded equipment they have, as this is not imported or retailed, it is used equipment and there is no rule to stop the resale of used equipment. The objective of the law is to keep ANYMORE cellular capable equipment from being put on the private consumer market. Its not meant to eliminate sales of equipment that is already here in the country or already owned by consumers. Soap box mode off.

From: bruce@bumetb.bu.edu
Message-ID: <3hieka$2qc@news.bu.edu>
Source record: 261347

I just bought a 2026 scanner and am quite please
with it with one exception. I'm disappointed that
it requires a constant 12volts to retain its
memories. I've noticed that if you interrupt the
12volts for a couple of hours the memories will
be retained but over night is too long and
everything is lost.

Are there any mods out there to address this issue?
There appears to be plently of room inside the box
to mount a battery but don't know if this is
possible. Any thoughts?

bruce

2087. 900 mhz cordless, where?

Newsgroup: rec.radio.scanner
Date: 1995-02-11 13:40:23 UTC
From: steven@sgb.oau.org
Message-ID: <D3u8nD.1Jz@sgb.oau.org>
Source record: 261354

Well, I am getting bored with my choice of 14 neighbors on the 10 46 mhz band cordless frequencies - I heard the 900 mhz have more range (according to advertising of local Wal-Mart employee). I'd like to extend my monitoring to include the 900 mhz cordless phone users now.

What are the frequencies commonly used for 900, such as Uniden, AT&T, Panasonic, etc?

Please don't quote the so-called laws against this activity, I don't follow them, not bound by them, they are unconstitutional, the courts have prior rulings which state "no expectation of privacy", etc. In any event, nothing will stop me... and the freedom to exchange information is a basic right!

So, what's the scoop 9xx-9yy?

lou@gary.com wrote:

: I've heard it and read it several times over, that it is now illegal to
: monitor Cordless phones and the like, BUT, can someone please cite me
: the exact law or Legislation that brought this into being.

: I've not been able to confirm it, enough to back myself up in some
: debates.

: Any help would be appreciated very much.

I believe even the supreme court handed down a decision that stated there was *no* expectation of privacy for those who use cordless phones. It makes the new so-called law (which nobody obeys) quite mute. I mean, the new law can not assure privacy because the courts have said there is none. So perhaps in addition to the citation and interpretation, someone can offer what the so-called law was supposed to accomplish. My cordless is brimming with activity, I have a choice of 14 neighbors on 46 mhz to listen to - one guy hunting for work in finance and banking yesterday was most amusing "yeah, I am looking for work 'what kind of work?' err, well anything really, 'what do specialize in?' hmm, well banking, finance, anything really". How's that one! Ha Ha Ha... perhaps desperate, but I'd not hire someone who is an expert in "anything", especially not someone who is looking for "anything". Ha Ha ... that was a good one. He uses a phone that can change frequencies on each call, I am still tracking the ones his phone can do.

Anyhow, I'd appreciate info on 900 mhz frequencies known to be in use, as I'd like a little more pickings to choose from for my entertainment. No law will stop me. The cellulars are good too - but I like folks I know something about and don't change cell sites! Hmmm tasty listening! (I'd like to charge this purchase to my ... card, the number is ... and it expires ... yes, my address is ... the name listed on the card is ... my home phone number is ... BINGO! successfully identified... time to stop recorder and playback what it received)

Terry Steinford (tls@gate.net) wrote:

: Public Law 103-414 signed Oct 25, 1994 was H.R. 4922

Does anyone have the law as it's worded in terms a judge could read from and not the "change history" of the law wording? I mean, I'm sure they don't take the original base law, and then overlay each change to it when they are confronting the accused with a charge, or do they? I mean those changes as listed mean nothing. I could not, for example determine the penalties, there were not listed except add and strike.

I also should note that to charge someone with breaking the cordless or cellular monitorning "laws", the law enforcement officer must personally witness the action taking place. You can't go and say "this guy on the internet listens all the time, it's against the law - go arrest him", as that is not evidence, that's speculation based on what he's said or written, but not the same as the officer standing beside him at a shopping mall listening to what he is listening to first hand or receiving a tape made by someone monitoring, etc, or someone stating directly to the law first hand, what they "heard".

So, that means next time you hear a bank heist being planned, a robbery being prepared, or someone being kidnapped, you're supposed to ignore it - or you could land in jail as quick as they could - what is worse is that they will get away because the law can not use the conversation as evidence and have no other proof a crime was about to be committed. Hence, no law broken by them, but one was broken by you.

The so-called law only protects criminals and leaves a mistaken opinion of privacy, it does not insure it, does not enforce it, it simply interferes with law enforcement activity. It's time both the cordless and cellular were looked at as broadcast radio stations requiring an individual to license for x mobiles, x handhelds, each with call sign, given atleast every 30 mins of airtime and all the privacy (supposed) monitoring laws repealed. The requirement of call sign ID every 30 minutes would remind the users they are a broadcast station and there could be others listening, hence the ID requirement.

As I said elsewhere, the laws have not stopped myself or anyone I know, so what good are they, and why did they waste the time to make them?

(oh I know the answer - to waste the taxpayers money is why they made them!)

Dan Bjarnason <dbjarnas@toronto.cbc.ca> wrote:
>can anyone advise the differnece between lsb and usb?
>what would one find there?

These are AM-like modes. In a full, normal AM signal, there are three components, the carrier, the upper sideband and the lower sideband. For some communications, a variation called single side band is used, in which one sideband and the carrier are eliminated. You can do this because the sidebands are mirror images of each other. You do, however, need the carrier to make anything intelligible out of the signal, so the radio you are looking at has a device that replaces the carrier. It needs to know, however, which side of the signal to place the carrier on. If it is a lower sideband, then the carrier needs to go above it, if it is an upper sideband, then the carrier needs to go below it. So try one mode, and if it sounds squeaky and unintelligible, use the other one.

>the yupiteru can do scans in various frequency steps ... what is
>the most practical step to set?

Ummm... Taking a cue from my less-sophisticated scanner, I would offer the following recommendations about step and mode:

30-54MHz, try FM, .005MHz steps.
108-136, try AM, .025MHz steps.
136-174, try FM, .005MHz steps.
(sorry, my scanner doesn't do 200's, can't advise there)
380-512, try FM, .0125MHz steps
806-824, try FM, .0125MHz steps
824-896, try FM, .030MHz steps (if your scanner has this coverage)
896-960, try FM, .0125MHz steps

Some other things you might try, if your scanner goes below 30MHz, you might try FM, AM, LSB or USB there (but don't bother using FM below 27MHz) in .005 or smaller steps, and you might find some USB or LSB in the 144-148MHz range.

>many thanks ...

Quite welcome.

Radio Shack PRO-43 Modifications FAQ
CONTENTS

1. Introduction
2. Which units can be modified for extended frequency
reception?
3. Companies that will modify the PRO-43 for extended
frequency reception
4. The modifications
extended receive (original mod + solderless)
keypad beep delete
improved audio
attaching an S-meter
400 memory channels

---

1. Introduction

Because there is a continuing demand for it, this mini-FAQ about PRO-43 modifications will be posted every two weeks until there is demand for its removal. In large part, it is the file PRO43.MOD from pub/hamradio/mods/tandy at oak.oakland.edu .

The FAQ now includes mods for

(1) extended receive (original mod + solderless)
(2) keypad beep delete
(3) improved audio
(4) attaching an S-meter

There is also a mod for 400 memory channels, but, to quote its author, it is very complicated, should only be attempted by someone with moderate to advanced electronics experience, and is not for the faint of heart or the "weekend technician." A brief description is included at the end of this FAQ. If the mod were included in its entirety, the size of the FAQ would be increased four-fold.

---

2. Which units can be modified for extended frequency reception?

Note: It is against the law (Electronics Communications Privacy Act of 1987, public law 99-508, amended 1994 by public law 103-414) to listen to cellular or cordless telephone communications. However, it is not illegal to own equipment the can receive or can be modified to receive such

communications, even though it became illegal as of April 1994 to manufacture or import equipment that could be easily modified by the user to receive cellular communications. Equipment manufactured before the cutoff date can continue to be sold until stocks are exhausted. While businesses are forbidden from importing cellular capable scanners for resale, the question has been raised whether an individual can legally import such equipment not intended for resale. The issue is not explored here.

Which PRO-43 units can be modified for extended receive?

Modifiable | Nonmodifiable
|
serial number no A in # | begins with A
FCC-ID AA020-300 | AA020-300A

Inside the battery compartment is a paper label containing the date of manufacture in the form "month A year". For example, 5A3 is May, 1993. The cutoff date after which units could no longer be modifiable is April, 1994 (4A4). So far, the earliest reported date of manufacture of a nonmodifiable unit is 3A4 (March, 1994).

The PRO-43 was produced under two brand names. My 3A3 unit carries the Realistic name; my 12A3 unit carries the Radio Shack name. At the moment, it is not known whether this represented a change in labels or whether both types were produced side-by-side for a time. It is also not known whether their electronics are different.

There are no software modifications for the PRO-43. It is not possible to extend the frequency range of the radio by pushing buttons on the keypad. Such modifications are possible with other models, such as the PRO-51, but *not* with the PRO-43. The PRO-43, made by GRE (General Radio Electronics) of Japan, is one of Radio Shack's few triple conversion units. Radio Shack scanners with software mods are double conversion units made by Uniden.

Modification procedures for other radios are available by anonymous ftp from the pub/hamradio/mods/<manufacturer> subdirectories at oak.oakland.edu.

There is some debate about whether step (5) of the extended receive modification is worthwhile. To quote Bob Parnass, below:

"Now that I have a schematic, I see that the European version of the PRO-43 has different coils and capacitors in the low (mid) band front end filter. That explains why the 75 MHz sensitivity isn't stellar after adding diode D3 to enable 30-88 MHz coverage."

So, if you trash the diode in step 4 or want to quit while
your ahead, don't lose sleep over it.
---
3. Companies that will modify the PRO-43 for extended
frequency reception

If you'd rather not do the modification for extended
frequency reception yourself, Cellular Security Group, 106
Western Avenue, Essex, MA 01929 (508/768-7486) will do it for
$40, which includes insured UPS return postage. However, CSG
will not move the diode to extend the low band to 88 MHz; they
only remove the diode to unlock the 800 MHz frequencies. When
CSG is mentioned on the net, two types of comments follow:
testimonials from satisfied customers and comments from those
with the technical skills claiming that the service seems high
priced for just removing the diode. But, there have been *no*
reports of shoddy work or damaged radios. (They've modified
two of mine.) Units are processed within 24 hours of receipt.

Grove Enterprises' newly advertised Repair Service will
perform the mod for $40 plus shipping. They will move (rather
than just remove) the diode on units that can benefit from it,
but state that there is no way to tell whether the diode
should be moved without looking inside. They claim that the
determination can not be made from the serial number, FCC-ID,
or date of manufacture. For further details, call Grove at
704/837-7081. In order to get a unit modified, a service
order number must be obtained from the same telephone number.
Packages without a SO# will be refused.
---
4. The modifications

From: armille@afterlife.ncsc.mil (A. Ray Miller)
Summary: cellular (870-890 MHz) and low band (51-88 MHz) restoration for PRO-43

A few people have mentioned the cellular mod for the PRO-43; it turns out
you should not remove but MOVE the diode. Doing so allows cellular coverage as
well as low band (up to 88 MHz) coverage.

Acknowledgments to Grove Enterprises; this information came from them.
They are selling the PRO-43 for $300 which is $50 less than Radio Shack.
I have no connection with them other than as a satisfied customer.

PRO-43
Cellular Frequency Restoration and Low Band Expansion

Note: It is not lawful to monitor cellular or conventional mobile telephone
conversations.

The following procedure requires familiarity with microcircuit soldering and
will violate your warranty. Grove Enterprises assumes no liability resulting
from its attempt, nor will accept the modified scanner for return under any

condition.

TOOLS NEEDED: Fine point, low power soldering pencil; solder wick or a desoldering tool; pointed awl, hemostats or pointed tweezers; small Philips screwdriver; solder.

1) Remove the battery, antenna and back cover (held in place by four screws).

2) Remove the six screws holding the top circuit board in place. Carefully unsolder the two antenna connections from the board. Bend the antenna ground tab fully up from the board. Carefully lift the board, unplugging the black connector at its base, and lay the board out of the way on its bundle of colored wires.

3) Remove the two screws from the next board and lift it, carefully unplugging the white connector at the bottom of the board. Lift it up and lay it aside on its brown wire (which can be unplugged if necessary).

4) Unsolder and remove the metal shield from the final board, revealing the microprocessor; note the row of diodes labeled D1-D5 above it. Only diodes D1, D2, and D4 are present; assisted by a pointed tool, unsolder and remove D4, the lone diode (this restores cellular frequencies which will be searched in 30 kHz steps).

5) Resolder the removed diode carefully into position D3 to extend low band coverage to 88 MHz.

6) Reassemble the boards, paying particular attention to the alignment of the plugs. Test the radio by entering any frequency between 870 and 890 MHz (cellular) and 51-88 MHz (low band).

From: IN%"savage@dg-rtp.dg.com" 2-FEB-1995 17:55:07.31

BTW, I did something similar [to the mod that follows] but MUCH easier... No soldering, removing antennas, PCBs, etc..

Just open up the Pro 43 and look down on the bottom PCB from where the batteries usually lie. You'll see the diodes there. Simply take an xacto knife and and break the solder on the D4 diode (left-most on mine) on the side facing you. I just cut back-and-forth for a bit. Once the solder (it's surface mounted) is weak enough, I just bend up the diode a bit from the PCB. Presto. I left mine hanging on the one side with solder. If you continue to work it a bit, you can probably remove the whole diode.

--Ed

From: springel@umich.edu (Jason G. Springel)
Subject: MODing a Pro-43 without soldering

I just purchased a new Pro-43 to replace my Uniden 200XLT after reading many of the praises for the Pro-43 on this newsgroup. I decided to try and MOD it, but don't have a lot of experience with a soldering iron. After examining the scanner's innards, I found it was quite easy to "fix" with nothing more than a minature philips screwdriver and some small needlenose pliars.

********** Standard Discalimer from other MODs:

1-It is against the law to monitor cellular or mobile telephone calls.

*****2-Procedures outlined below [DO NOT] require knowledge of microcircuits, soldering and assembly techniques.

*****3-You will [NOT] need a low-wattage soldering iron, solder and other various tools to help in the procedure.

4-The following procedure will void your warranty.

****
Here is my new MOD:

Step 1

Remove the battery, antenna, and back cover which is held in place by four screws. Place the scanner keypad-side down on your working surface.

Step 2

Remove the six screws holding the top circuit board in place.

Step 3

Using a VERY small screwdriver (I used one from a Radio Shack kit), remove the two screws from the lower circuit board. Looking down at the unit, you will see that the screw on right side of the lower circuit board can be easily removed. Remove the screw on the left side by by sliding the screwdriver between the top circuit board and the metal frame which holds the two boards together.

Step 4

With these two screws removed, you can now lift the entire top panel (antenna, volume, and squelch knobs) along with the top two circuit boards as one unit. The two circuit boards will be connected to the final circuit board (the one attached to the front section of the scanner) by several wires. Simply set the top panel/circuit boards alongside the front section of the scanner and you can leave these wires connected.

Step 5

The microporcessor is located under the large metal shield on the final board (the front section of the scanner with the display and keypad). If you look under metal shield from the side closest to the bottom of the scanner, you should see the row of diodes labeled D1-D5.

Only diodes D1, D2 and D4 should be present.

Use a small pointed tool to break off D4. You actually don't have to remove it completely (unless you want to use it to restore additional frequencies as explained in other MODs), you can just lift one side so it dosen't make connection and then put a small piece of tape or heat shrink over it, so it won't. Make sure it's not lifted to high or the boards will not fit.

This will restore Cellular Frequencies in 30 kHz steps.

Step 5

Reverse the process to replace the top panel/circuit boards and the two screws that connect the lower circuit board. Replace the 6 screws from the top board. Replace the cover, etc.....

...the diode positions on the cpu board, of which only three are filled look like this. Where X equals a diode soldered in place.

D5 D4 D3 D2 D1

O X O X X Normal configuration

O O O X X Cellular modification(D4 removed)

O O X X X Lo-Band modification(D4 in D3's place)

These directions were based on an original MOD design whose origins I do not know. My thanks go out to the original author of that MOD!
Hope this helps those of you who do not own a soldering iron!

From: ross@novax.llnl.gov
Date: 19 Aug 92 16:51:08 GMT

Here is my keypad beep delete mod for the RPO-43:

1. Remove battery.
2. Remove back cover (4 screws).
3. Remove top board (6 screws, desolder two antenna connections and bend antenna ground lead up out of the way). Be careful of black connector at bottom of board. Flip board over and lay aside (wire connectors need not be disconnected).
4. Remove middle board (remove 2 screws and wire connector). Be careful of two multi-pin connectors along underside of board. Set middle board aside.
5. Locate 10 pin connector on side of bottom board (labeled CN3). Note that one end of connector has pin 10 labeled as such. Count back to pin 6 and bend pin 6 ninety degrees towards the large RF shield. Make sure the bent pin clears the RF shield.
6. Reassemble and your done OR do the cell mod since you are so close.

Have fun. Gary Ross >usual disclaimer>

Subject: Improved audio for the PRO-43 portable scanner
From: parnass@cbnewse.cb.att.com (Bob Parnass, AJ9S)

Date: Wed, 2 Dec 1992 01:15:35 GMT

IMPROVED AUDIO FOR THE PRO-43 SCANNER

by Bob Parnass, AJ9S

The Radio Shack PRO-43 scanner audio is too bassy.1 The lack of treble makes it difficult to hear the PRO-43 in noisy situations, especially while listening in a car or truck. Louis Shirley sent me a schematic and suggested I remove C341, a tiny 0.015 ufd surface mount capacitor.

I'm glad to report that removing C341 made a great improvement. The audio is now much "crisper," more like the Uniden 200xlt, although still not quite as loud. Turning the volume control up still overloads the PRO-43's small, internal speaker, but there's less need to do that once C341 is removed.

The PRO-43 contains 3 printed circuit boards, and the middle (second) board contains the audio circuitry. Finding C341 is difficult, as it is neither marked with a value nor a component designation. It is located on the foil side of the middle board, under IC304, an LM386 amplifier IC. C341 is in parallel with, and physically next to, R350 (33,000 ohm). R350 is slightly larger than C341 and is marked 333. Both R350 and C341 are connected between pin 2 of the LM386 and ground.

A Note About 50-88 MHz Reception

Now that I have a schematic, I see that the European version of the PRO-43 has different coils and capacitors in the low (mid) band front end filter. That explains why the 75 MHz sensitivity isn't stellar after adding diode D3 to enable 30-88 MHz coverage.

---

1. See "PRO-43 Product Review," by Bob Parnass, AJ9S, in the November 1992 RCMA Journal.

Subject: S-Meter for PRO-43
From: schuster@panix.com (Michael Schuster)

Found this on the Fidonet scanner echo:

=====begin quoted text=================

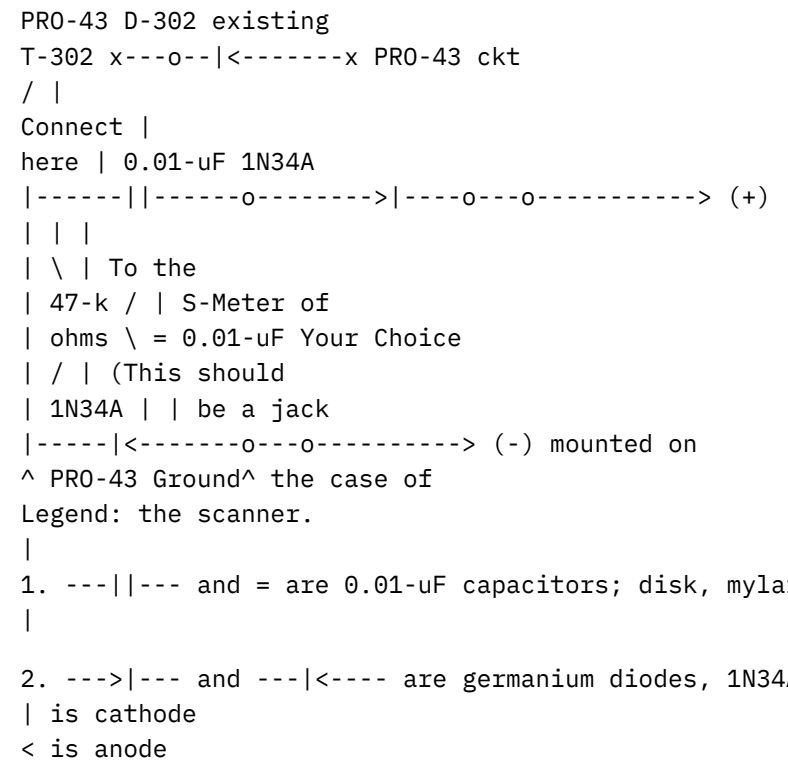
Date: 02-06-93 00:24
From: Bill Cheek
To: All
Subject: PRO-43 S-Meter!

Greetings Scanner Fans!

It had to happen! The fundamentals for an S-Meter exist alive and well in the PRO-43! Only a simple circuit and your choice of meter, analog or LED, is required for a jim-dandy S-Meter function!

The key point in the circuit is the cathode of D-302 located on the bottom (solder side) of the AF Board (middle board). You will need the Service Manual for the PRO-43 to find it as it's not marked and it would take me 10,000 words to guide you to exactly where it is located. Call Tandy National Parts at (800) 442-2425 to order your manual: approx $10. Now here is the deal:

Locate D-302 and either build the following circuit right there on the back of the AF board in the vicinity of D-302, or solder a wire to the cathode of D-302 and route it to somewhere else more convenient to feed the below circuit. This wire ought not to be very long, though, say not more than a couple of inches. Refer to the ASCII schematic diagram as follows:



1. ---||--- and = are 0.01-uF capacitors; disk, mylar, monolythic, chip
|

2. --->|--- and ---|<---- are germanium diodes, 1N34A
| is cathode
< is anode

3. o means a connection, preferably soldered

4. The 47-k resistor is self-explanatory, I hope.

5. -------- and | are wires/conductors.
|

|

6. x is existing PRO-43 circuitry

If you use an analog meter, preferably a real S-Meter like salvaged from an old junked CB rig, then rig it as follows to connect to the circuit above:

```
5-k Trim Pot
(+) --------/\/\/\/\---o--------|
| | |
This should |-------| |
be a plug of +
some sort to The S-Meter
connect to the Terminals
mating jack on -
the scanner |
|
(-)----------------------------|
```

You can also build the 10-segment LED S-Meter as shown in Volume 2 of my SCANNER MODIFICATION HANDBOOK, available from leading mail order radio dealers everywhere. ISBN 0-939780-14-3 published by CRB Research Books, Inc. Commack, NY.

After connected and working, locate the PRO-43 very near a known strong transmitter, perhaps a ham transmitter, a police cruiser, your favorite security guard's handheld or right next to a cordless telephone, or anything else known to transmit a strong signal. Tune the scanner to the frequency, and adjust the 5-k trim pot above so the meter reads exactly full scale. All other signals will read proportionally lower to yield "relative signal strength" measurements! A hell of a circuit here, boys & girls! Have fun!

Subject: PRO-43 w/400 CHANNELS HERES HOW!

IT IS NOT FOR THE FAINT OF HEART however.

PRO-43 ENHANCEMENT
MEMORY EXPANSION & "FADE-AWAY" LIGHT
Brett Bennett 4/12/94
bbb@kuhub.cc.ukans.edu
Copyright 1994 B&D Electronics All Rights Reserved

INTRODUCTION

The following document details two enhancement modifications that are possible on the Radio Shack PRO-43 scanning radio. The first modification doubles the factory standard memory capacity, allowing you to enjoy an additional 200 channels of memory, plus 10 more monitor memories. After completing the first modification, it is a fairly simple matter to add a 7 to 10 second delay feature to the LCD back-light lamp circuit. I designed and performed these modifications on my PRO-43 and they do work. As I understand it, there (has been/is being) presented in WORLD SCANNER REPORT a similar memory expansion. I have not seen this modification and for all I know it is a better way of doing it. What is presented is a 'clean-room' design of my own that to the best of my knowledge is the only one to also offer a time-delay for the LCD back-light. Having said that, let me say:

I ASSUME NO RESPONSIBILITY FOR ANYTHING THAT MIGHT HAPPEN TO YOUR RADIO SHOULD YOU OR ANYONE ELSE ATTEMPT THESE MODIFICATIONS. WHILE REASONABLE CARE HAS GONE INTO THE PREPARATION OF THE FOLLOWING DOCUMENT, I CAN NOT GUARANTEE THAT THERE ARE NOT ERRORS.

The procedure described below is very complicated, and involves the soldering and desoldering of very tiny components and the cutting of printed circuit board traces. While the procedure is not irreversible, it will leave permanent scars inside your scanner. It should only be attempted by someone with moderate to advanced electronics experience. I don't think it should be attempted by, to quote someone else, a "weekend technician." If as you read through this you feel intimidated by the jargon and required procedures or if an electronic schematic looks like a strange piece of modern art to you, then this might not be the 'mod' you are looking for. The following document will assume you have obtained the materials listed below, especially the Service Manual, and you have studied the circuit in some detail. I will not describe in great detail where every component is or where every solder point on the logic board should be placed. Having the Service Manual, and having studied the drawings therein will allow you determine to where it is I refer.

REQUIREMENTS

1 - PRO-43 Service Manual. (Tandy Parts # MS-2000300 - approx. $6.00)
1 - CD4053 - Triple - SPDT analog switch - Surface mount package (DigiKey #CD4053BCM-ND - approx. $1.50)
2 - 93C67 EEPROMs (Tandy Parts # MX-8050 - approx. $13.00/each)
1 - 100k x 5 resistor network. Common lead type. (DigiKey # Q5104)
1 - UN2111 PNP transistor (Q1 on Logic PCB. Tandy Parts #)
1 - 1 uF 16v capacitor.
1 - 10 MOhm 1/8-1/16W resistor.

Misc.:
Wire wrap wire-30 gauge. (Radio Shack)
Grounded soldering iron with approx. 1/32" tip or smaller.
Desoldering Equipment.
Digital Volt Meter. (Used to double check your VCC and Ground connections, pre-check switching assembly)
Utility knife with fresh sharp small blade. (Needed to cut traces.)
Strong hand held magnifying lens. (Needed to check solder joints.)
+5-10 Volt bench power supply. (Used to check switching assembly.)
Anti-Static work place and grounding wrist band.
Very fine needle nose pliers, wire cutters.

:

I'm sorry to say that the realistic scanners in Canada are blocked out too. The salesman at my local store tryed to tell me it was illegal to monitor cells here. Yeah, right. Just like cordless is... Sure, buddy! Here in the TRUE land of the free, we can monitor *any* freq being broadcast.

You might find a company in Canada that might mail order you one... It's just the idiots at RS figure they're American owned, so they shouldn't carry the stuff here. Too bad, it would SELL....

Ever heard of a 'super converterII' by GRE? You'll find their ads in Monitoring times. I own one, and I must say it works great. I've got a PRO-44 that receives the 400MHZ range just fine, so with the super converter which shifts the cell range (800mhz) down, I can pick it up just fine. I think they sell for about $89US.

In my area, the police, FD etc. use radios around 140-143mhz. But, most of the local pager companys transmit on about 145mhz. I don't have troubles with my outdoor antenna, but mobile whip picks up pagers stronger than the police on their freq's!

Can anyone tell me what is wrong? Is my antenna out of tune?

Scott.

Actually, 824-849 and 869-894 needs to be 10 KHz steps on the Yupi since it has no 30 KHz capability. Makes for very slow scanning but at least all the channels are scanned.

By the way, you'll soon discover how much the *minimum* 2 second delay SUCKS for scanning 800 MHz trunked stuff. You'd think that these same folks who designed 5 different battery save functions into the radio could have made more than 2 choices of delay (2 or 4 seconds). Otherwise, the Yupi is a supurb radio. Sometimes I wonder if there are engineers paid to think up STUPID things to do to radios just to make sure there is no such thing as a near-perfect radio. :-/

Hmmm ... shouldn't cost anything to restore cellular. All one has to do is clone the UK version to the USA version. The AOR CU-8232 interface allows that. No software required since the cloning function is built into the AR-8000 (both the USA and UK models).

While the scanners RS sells in Canada are blocked the majority of them are modifiable to receive cellular. The unmodifiable ones have not reached CDA yet, at least here in Manitoba. I just bought a Pro 43 which is totally modifiable also the 2006 is still modifiable. Many of the Uniden models sold in CDA are unblocked for cellular. This may change soon however!

The Shack stuff is blocked. It is not illegal to monitor cell in Canada, but
shack only sells blocked scanners, because they sell cell phones.

After 33 yrs in computer maintenance and two PCs at home I
think I'll get into scanning. I need something else, a diversion. I've
been reading the radio and scanner news groups for a month or so now and
of course I find out that scanning is getting PC'ed so I guess there's
no getting away from it.{:-) I would like to draw on on all that
expertise out there to get me started.
I am open to all info. Would like your opinions on a good
scanner to start with. I am leaning toward a handheld but could also go
for base unit on the counter instead. I have looked at PRO-62 And
Pro-2035!?? Do most have good luck when buying from the net sellers???
or is that real chancy??? Saw a PRO-2006, with mod for $300 on net, Good
deal????
Post to newsgroups for other rookies to read or Email, either
OK. Thanks in advance, Al

Here is an interesting article I picked up from a local BBS. Seems like the best explanation I have heard regarding the name "Ham". Guess if some one really wanted to check it out they could go to the Congressional Record for the dates listed as well as newspapers of the time. Anyway it sounds good. Hope you enjoy.

WHY RADIO AMATEURS ARE CALLED "HAMS"
From Florida Skip Magazine - 1959

Have you ever wondered why radio amateurs are called "HAMS"? Well, it goes like this: The word "HAM" as applied to 1908 was the station CALL of the first amateur wireless stations operated by some amateurs of the Harvard Radio Club. They were ALBERT S. HYMAN, BOB ALMY and POOGIE MURRAY.

At first they called their station "HYMAN-ALMY-MURRAY". Tapping out such a long name in code soon became tiresome and called for a revision. They changed it to "HY-AL-MU", using the first two letters of each of their names. Early in 1901 some confusion resulted between signals from amateur wireless station "HYALMU" and a Mexican ship named "HYALMO". They then decided to use only the first letter of each name, and the station CALL became "HAM".

In the early pioneer days of unregulated radio amateur operators picked their own frequency and call-letters. Then, as now, some amateurs had better signals than commercial stations. The resulting interference came to the attention of congressional committees in Washington and Congress gave much time to proposed legislation designed to critically limit amateur radio activity. In 1911, ALBERT HYMAN chose the controversial WIRELESS REGULATION BILL as the topic for his Thesis at Harvard. His instructor insisted that a copy be sent to Senator DAVID I. WALSH, a member of one of the committees hearing the Bill. The Senator was so impressed with the thesis is that he asked HYMAN to appear before the committee. ALBERT HYMAN took the stand and described how the little station was built and almost cried when he told the crowded committee room that if the BILL went through that they would have to close down the station because they could not afford the license fees and all the other requirements which the BILL imposed on amateur stations.

Congressional debate began on the WIRELESS REGULATION BILL and little station "HAM" became the symbol for all the little amateur stations in the country crying to be saved from the menace and greed of the big commercial stations who didn't want them around. The BILL finally got to the floor of Congress and every speaker talked about the "...poor little station HAM". That's how it all started. You will

find the whole story in the Congressional Record.

Nation-wide publicity associated station "HAM" with amateur radio
operators. From that day to this, and probably until the end of time in
radio
an amateur is a "HAM"

Source record: 261373

Scott,

I doubt that the pager companies are using 145mhz for transmitting.
145mhz is an allocated amatuer frequency. Probably what you are hearing
is what is know as "cross-modulation". This the interference of signals
in closs proximity to your receiver, or "overloading the front end" of
your radio. Unfortunatly, pager companies are known for extremely
powerful output and have a tendency to "band-splatter" and overload
everything from ham-radios to scanners. I resolved the problem by
purchasing a higher quality receiver.

Your subject says it all. Pagers are the bane of scanning and amatuer
radio enthusiasts alike.

Good luck,
Charles

: standardize on a program like Microsoft Access. No matter how good
: it is, someone out there could not use it.

: Therefore what information should be posted in comma or tab delimited
: fields that each ones own database program coiuld rapidly read and use.

Even though I use Access, I agree that it is a bad choice for a "standard". What about dBase-formatted? Most database programs can import dBase files, as can spreadsheets and some word processors. Comma or tab delimited adds an extra conversion step that complicates life for inexperienced users. How about copying the format of some commonly available dBase file (Percon CD?) as the "standard"?

Another suggestion would be to use the AR8000's "MX" format so it would be ready to load with no conversion other than bank and channel editing.

You can get a CD with the FCC database and a mapping program
from Grove Enterprises, PO Box 98, Brasstown, NC, 28902.

If you just want a mapping program that includes county lines,
you can try Precision Mapping by S&S Publishing, Inc, PO Box 552,
Lemont, IL, 60439. Their current edition is a DOS application, but they
plan to make it a Windows app for the next release.

Message-ID: <D3v6vL.6v9@sunfish.usd.edu>
Source record: 261384

Hello Bearcatters... here is my problem.

My scanner will not turn on when using just the battery pack.
I have had both that I own checked, and they are both fully charged, and OK.

If I plug the scanner in to AC, and turn the scanner on it works fine, I can even disconnect the power plug and run the scanner off batteries.

The scanner won't "fire up" off batteries alone, it just clicks.

BTW... in the coursed of trying to figure this problem out, I did do one of the "battery mods" just to see what would happen. Nada.

HHHHHHHHHHHHHHHEEEEEEEEEEEEEEELLLLLLLLLLLLLLLLLLLLLLLLPPPPPPPPPPPPPPP!!!

Does anyone have a suggestion??

Kent

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

...

PRO2021: Base/mobile scanner. 200 channels in 10 banks,
LCD display and raised rubber keys. Lots of memory but
scans too slowly and lacks 800 MHz. Ten "monitor"
channels. Radio Shack seemed to have an overstock of 2021s
as they were on sale for such a long time. Close out price
dipped to about $200, which made it a nice scanner for
beginners. |

PRO2022: Base/mobile scanner. Like the PRO2021 but |
includes the 800 MHz band. Cellular images throughout the |
847.6 - 869 MHz range. Includes power saver circuit, odd |
for a base unit, which can clip the first part of a |
transmission.
...

I have performed these modifications on my PRO-2022 to suit a specific
purpose -- unattended operation:

1) added toggle switch which defeats the electroluminescent
backlight.

2) added fixed level audio output jack, used to feed low level
audio to an in-home repeater made from a modified baby monitor
transmitter.

Also:

- added a flashing green carrier light (LED).

Dave:
Amateurs have been given permission to retransmit NASA select during shuttle missions, with some retransmissions occuring on Amateur Television remote bases and repeaters. Some of the Amateur Television repeaters have outputs that are accesable by cable ready televisions using outdoor antennas. The best bet is to check with some of the local amateurs in your area to see if NASA select television is being retransmitted.>

From: ncarrigan@aol.com
Message-ID: <3hk8jo$cbi@newsbf02.news.aol.com>
Source record: 261394

I finally obtained the Pro2006 455khz mod and I just made it about an hour ago. It works very nicely, albeit it wasn't as simple as the mod mad it sound. Well, I guess it could be if my technique was vastly improved.

Anyway, I was wondering if anyone else has this mod and what exactly they did, in terms of connectors, etc... Right now, I presently just have a wire antenna coming out of the screw-in antenna hole, so I'm looking for suggestions on the best connectors, etc... I'm using a Drake R-8 with the 2006 and it does seem to work like a charm. The only bad thing is, if the 2006 is too close to the R8, the really strong signals will create some sort of feedback vibration.

Also, I'm wondering what the 2006 with the 455 khz can do that I haven't thought of? And if possible, I'd like to get my hands on some freqs that take SSB? I know of the ham ones, but I'm curious to know if there are others.

Nick

From: jeevan@chinook.halcyon.com
Message-ID: <3hk92e$nci@news1.halcyon.com>
Source record: 261396

Personally, I have found my battery life to be pretty good. I used one battery two hours a day for about two and a half days, just this week. With two batteries, you can berly stay up as long as the batteries last. And my BC2500XLT came with two batteries. :). I have been pretty satisfied with this scanner which I got only a couple of weeks ago. It's not cell moddable, but from what I read about the BC3000XLT, even though the performance sounded better, I didn't like the sound of the idiot features. But I love MS-DOS too, so I'm just strange :->

From: jeevan@chinook.halcyon.com
Message-ID: <3hk9h2$gp@news1.halcyon.com>
Source record: 261398

Isn't that because the pagers always have such miserable recievers in them? I mean, the range most pagers get (local pagers) could be done with maybe 20W if the pagers had good antennas and receivers, right? I live in an area with few paging towers, so this doesn't really affect me, but don't most paging companies use too much power for the application?

When you go to a fancy restaurant.. you tell them how many in your party and smoking or non and they hand you a pager.. it's white and about the size of a brownie.. it's almost perfectly square. It will have a number on it.. like 15 which is what they will page you with.. you have a short range of just in the immedite area of the restaurant. When your are next for a table they will page you.. the terminal they page from is just a large box with a telephone type keypad on it.. and the # button serves as a page button... there is a BNC connection at the top of the box but I've even seen restauants have coax going up a pole with the antenna mounted on the pole.. I guess they do that no only for range but usually because this box is right there on the hostess stand and they want it to look halfway professional. When your pager goes off.. it will vibrate a serious of pulses over and over for about 21 seconds. I should mention that this pager has no obvious buttons on it.. you would have to use a pen or pencil to turn it on or off because of the recessed slide switch it has. The antennas that I have seem are most likely VHF as they usually the same you'd expect to find on a VHF handheld. I suspect something like 154.515 or something like that..

Guess I just need to camp out in the parking lot of one of these places on a crowded night.. and put in all the low power type freqs fro police call until I can confirm something.

I use what PerCon recommended to me; AutoMap Pro with the AutoMap Steets CDROM. AutoMap pro costs about $400 and streets is ~$35. you get one "free" extended map an you must enable the others as you need them for a fee. (they had a special to enable the entire disk for $200 a while back). they can be contacted at 206.455.3667 (btw automap pro was purchased by microsoft so this ddata may nolonger be valid)

it works great! the PerCon software (FCC 3.1.1) will export data directly to .DBF format supported by automap (lat long conversions are required).

i checked out MApExpert and it DOES NOT support database input, all entries are by hand.

You might be Considered a Redneck if...

* Your front porch collapses and you kill more than 6 dogs

* You've ever used lard in bed

* You think potted meat and saltines are an hors d'oevre

* There is a stuffed possum mounted anywhere in your house

* You consider a six-pack of beer and watching a bug-zapper quality entertainment

* Less than half of the cars you own run

* Your mother doesn't remove the Marlboro from her lips before telling the state patrolman to kiss her ass

* The main color of your car is "primer"

* You honestly think women are turned on by animal noises and seductive tongue gestures

* Your family tree doesn't fork

* Your wife's hairdo has ever been caught in a ceiling fan

* Your mother has ever been involved in a fist fight at a high school sports event

* You've ever B-B-Qued spam on the grill

* The neighbors started a petition concerning your Christmas lights

* Your brother-in-law is your uncle

* The rear tires on your car are twice as wide as the front ones

* You consider True Story and Field & Stream deep reading

* You prominently display a gift you purchased at Graceland

* The diploma hanging in your den includes the words "Trucking Institute"

* You've ever worn a tube top to a wedding

* You think Dom Perignon is a Mafia leader

* The most common phrase heard ar your family reunion is "What the hell are you looking at, Shithead?"

* You think beef sticks and moon pies are two of the major food groups

* You think Campho-Phenique is a miracle drug

* You have more than two brothers named Bubba or Junior

* You think a Volvo is part of a woman's anatomy

* You think the styrofoam cooler is the greatest invention of all time

* You have a rag for a gas cap

* You had a toothpick in your mouth when your wedding pictures were taken

* You've ever used a weed eater indoors

* Your lifetime goal is to own a fireworks stand

* You have a fly-strip hanging above the kitchen table

* Your matchbook doubles as a toothpick

Cross-posted to: rec.radio.scanner,alt.radio.scanner

In article <D3vBA9.9wr@agora.rdrop.com>,
Steve Culliton <stavros@agora.rdrop.com> wrote about the BCT-7:

>.... Is it really pre-programed for all states?

Using a keyboard sequence, the scanner will scroll through
all states one by one displaying the state abbreviation, e.g.,
IL. You indicate which state you are in and the BCT7 will
use the freqs for that state from then on.

The guy who consulted with Uniden and provided the frequency
information for this model is a cop and member of my scanner club.
I can't say whether he made a mistake here or there, but
the Illinois State Police mobile extender and car-to-car freqs
looked ok to me.

The BCT-7 scans many 800 MHz frequencies which are used
by non-police agencies here and so I have concerns about
the accuracy of its choice of 800 MHz allocations.

I said:

>>The BCT-7 I had on loan was an early unit (sales sample #1, really)
>>and had image problems, including cellular phone images despoiling
>>the 800 MHz band.

Steve asked:

>How long ago was that?

Within the last 3 months or so.

>And did you have any other problems with it?

I had image problems on several frequencies when using
an outdoor antenna on the roof. That's no surprise as the BCT7
does not use up conversion. It is really designed for a specific
mobile use with a low (or no) gain antenna and I never took it
mobile. The evaluation sample didn't come with a DC power cord or mobile
mounting bracket. Perhaps they are included with production units.

The audio seemed pretty good, though. Seems like it would be
suitable for your use.

Source record: 261409
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I currently own a Realistic PRO-43 scanner. I'm thinking of getting a scanner with more features and continuous coverage. I've narrowed my choices down to the AOR-8000 and the Yupiteru MVT-7100. I'm leaning towards the 8000 as many of it's features are appealing (alpha tags, 50 chs/bank, RS-232, etc.). What I am really concerned about is the actual performance of the radio; things such as sensitivity, problems with images and especially intermod (I live in Toronto - big city, many pagers!). Is there anyone who has both a PRO-43 and an AR-8000, who might offer some observations regarding the above concerns? I consider the PRO-43 to be an excellent performer, so if the AR-8000 is at *least* as good, I'll get one.

Thanks in advance,
Michael J. Fenech

: First of all, I'd hire a lawyer...secondly, who wud want to pay your
: markup. the scanners are expensive enough w/o a middle man involved.

I should remind you also - Javiation in the UK, and Atlantic Ham Radio have no trouble shipping them into the U.S., so I'd like to modify the question to be why would anyone want one second hand from you when they can have one new for about the same price?

As for the AR8000, since it is possible to import them from overseas and Canada, and using the clone function adds cellular, it is possible for any enterprising folks in the US to purchase the radio and interface from the UK, purchase units from EDCO (the ones with FCC approval on them), upgrade them to full cellular, and resell them for a small difference in cost - with FCC certification - all without evening opening the units!

Now we have cellular units with FCC ID which can be sold in the US!

There are many options available now some are with fully alterable EEPROM storage for their program code. I guess they are like the V.34 modems, with FlashROM upgrade options. It will be nice when the Radio Shack and Uniden units have the same technology.

: but sometimes I can't change it and I hear some strange things

heheheh you guys are killing me. But seriously. last night I was doing my usual scanning, when I accidently entered 870.45, I heard an interesting conversation, but really tried my best not to listen. I tried unplugging my pro-43 from the power supply, but alas, my bateries were still in it. I tried to remove my scanner from it's protecting case, so that I could remove the batteries and here "NO MORE". Too late; by the time I removed my bateries, I heard the whole conversation. Oh well, At least I tried:)

Mainstream is available as SCA in most major cities. I know Chicago, NY, etc. all have this as a newsfeed service with all the AP, Reuters, Dow, etc. wires.

Nope, don't know how to read it but is is in a packet format, FEC overhead on a 25kbps system, and vesigal AM. Seems really fast for subcarrier.

OK, folks, get your decoder equipment out as this is not for the faint-hearted!

Interesting. Toothpolish has been recommended for repairing CD's. I don't know if this is effective 'cause I've never tried it myself, but it makes me wonder whether it wouldn't work here, too.
I'm just thinking out loud. Don't try this on anything you can't afford to lose unless someone else wants to take responsibility for giving you the go-ahead.

2150. Pro-44 modifiable?

Newsgroup: rec.radio.scanner
Date: 1995-02-12 21:38:49 UTC
From: bob@advantage.com
Message-ID: <3hlv59$j6d@scipio.cyberstore.ca>
Source record: 261417

My brother recently posted a message in this group regarding possible modifications to a Netset/RS Pro-44 which I got last week as a gift.

I have enjoyed listening to the usual police calls and some HAM stuff, but, I know that his Pro-43 has been modified to get access to other frequencies. What I was wondering is whether or not there is any information out there dealing with modifications to the Pro-44, specifically for the 800+ freqs.

On the back it says it's a Netset Mod 2-304 Pro 44. It has a DOC/MDC number of 255B253 and a serial number starting with C00.

Can anybody offer any assistance/information?

Private email or news replies would be much appreciated.

Thanks

Bob

2151. Basic Antenna Question

Newsgroup: rec.radio.scanner
Date: 1995-02-12 22:05:24 UTC
From: Reza@cerf.net
Message-ID: <Reza.1143014364B@news.cerf.net>
Source record: 261418

Since we live in a poor FM reception area , I often need to disconnect the whip antenna from portable radios and instead connect an outside antenna with 50 or 75 ohm coax cable. I usually connect the shield side of the coax to the radio circuit board ground and the center conductor to the place where the wire from the folding antenna used to go. I am wondering if this is the best way of connecting the antenna or do I need some soft of transformer (300-75), balun, etc. between the antenna and the radio receiver.

Now Jim all you need to do is explain why that requirement
exists. You can have a 15k step if you want but it will
only stop on frequencies that match the math.I think I know why
but I have more importqant things to do right now then
to explain it. (ie I am not sure <grin>)

About 3 weeks ago I proposed alt.radio.scanner.uk
most of the response (over 85 replies) were very positive.

A few people suggested instead a proposal of UK.RADIO.SCANNER

so I'm testing the water, to see what people think,

If people are in agreement, what do I have to do to start this group
does UK hierarchy works similar to alt, only I've been picking up
UK.NET.NEWS for a while and it doesn't seem very active.

(follow up set to uk.net.news)

>
Mike I have both and seldom use the pro43 anymore. I gave it to my wife
and she dosn't like it as much as the AR8000 which she will look at an
use. The display on the AR8000 makes more sense with all its data and large letters.
Performance wise they are similar with a much better antenna on the 43 for vhf/uhf freq.
There is much less intermod with the 8000 but there is occasionaly other types
of interferance that you may unexpectedly pick up. The ar8000 is much more sensitive
to low battery voltage and will give eratic audio in NBFM when the voltage has
dropped too low. It will still work in WBFM for some reason at that point
which is puzzling to me. WBFM is usually a continous broadcast while NBFM requires
constant scanning for new signal, maybe this takes more energy? Go figure?

There are many side benefits to the 8000, like being able to hear TV audio while
portable, being able to monitor a vhf state police repeater in priority mode
while listening to Broadcast Band, exiotic search programs suitable for tracking
a suspect using a cellular phone (if you are in law enforcement) etc. etc.

You get what you pay for in the Ultimate Handheld Radio, the AR8000.

>Does anyone know where I can obtain a list of freqs use dby San Diego
>Police and San Diego County Sheriff? (I have a scanner capable of the
>800mhz feqs.) I'm especially interested in the Tactical freqs.
>
Look for a police call book in any Radio Shack, or look for the
Gene Hughes Police Call book for Southern California. Either book
is about $10, I think. The Gene Hughes book is from this
company, in case you can't find it at a ham radio store:
California Radio Communications Co.
P.O. Box 35102
Los Angeles, CA 90035
(The 1993 edition was $9.95; don't know if prices have gone up
for 1995.)
(It looks like most SD Sheriff freqs are between 453.0 and 454.0,
but there are others, too. As of 1993, that is.)

2167. Ar8000 Crappy KeyPad??

Hello All..

A few friends and I are wondering if anyone else is experiencing the same problem as us??

The actual markings of Numbers, letters and Words on the keypad on the front of our 8k's has worn away very very quickly...

Ive had my 8000 for just on a week now and allready i have lost the `e' `f' `SRCH' and `ENT' markings on the keys and the others have faded aswell. :(I was being very carefull waiting for my pouch to arrive which is still on the way.. I DO NOT sit there rubbing the keys so its very weird.. Ive called the supplier and we are getting new Keypads supplied, but I was wondering if anyone else has noticed this or if its just us??

Our supplier wasnt a problem and has new pads on the way as i said but they said they havent heard of this problem, and i thought this would be a good way to find out..

I love the 8000 otherwise (apart from 1, 2 little complaints hehe) but i think that for the money this unit costs the letters should be EMMBEDED INTO the keys and not simply painted on where it can wear off! Ill be writing a letter off to Japan i think as a matter of principle..

Quote: Let a fool hold his tongue and he will pass for a sage.

Catch ya,
Woody

Yes, I got that when I played with the unit. I know that the display
will cycle through all the state abbreviations when you hit the button,
but I still have a nagging doubt. My question then, is it already
pre-programmed with all the states -freqs- in it as is, or does
it have to be re-programmed for a different state by the factory when
you want to use it somewhere else?

The manual is vague on this point, only mentioning the fact that it is
pre-programmed for *your* state. That doesn't seem to mean *all*
states. I punched up Washington to listen to, since I was in
Troutdale OR, and WA is just across the Columbia River, less than 2 miles
away. Not one call came in, but on the local police setting (while set
for Washington) the Portland OR police calls were coming in. This is
why I'm not sure it already has *all* the states pre-programmed in.

>The guy who consulted with Uniden and provided the frequency
>information for this model is a cop and member of my scanner club.
>I can't say whether he made a mistake here or there, but
>the Illinois State Police mobile extender and car-to-car freqs
>looked ok to me.

Did you check for or can you check for any neighboring state freqs
in the unit you have? When I set it for WA, all it said was WA and
had the word scan going across the face. However, I didn't pick up
a single WA call while waiting, but did get several OR calls while it
was set for WA.

>The BCT-7 scans many 800 MHz frequencies which are used
>by non-police agencies here and so I have concerns about
>the accuracy of its choice of 800 MHz allocations.

I wonder how that affects the performance. Still, when set on HP and
local police only, would this be a problem? Wonder if you can lockout
those extraneous freqs... Will have to go back and read the manual

bit more. Guess another trip to the truck stop is in order, providing some of the snow we just got melts a bit. I've got 3 ft. deep drifts in my yard from one nights worth of snow...

> >And did you have any other problems with it?

>mobile.

Time for a field trip!

>The evaluation sample didn't come with a DC power cord or mobile
>mounting bracket. Perhaps they are included with production units.

Yep. They've even got a wire ant. that mounts with suction cups to your windshield. A trucker there at the stop was telling me that it worked great like that.

>The audio seemed pretty good, though. Seems like it would be
>suitable for your use.

Sounds good. It's either that, or something like the Pro 2035 with that 4000 channel mod in it and a lot of Police Call reading and button pushing. :-)

Manufacturers use a cloth buffing wheel to get rid of scratches. I bought an attachment for my drill to try this on a scratched watch face (plastic), but I have not tried it to see how well it works yet.

Come to think of it, there don't seem to be too many triple-conv. mobiles. The ones I can think of are the Icom R100 (not the greatest scanner, but a solid performer), and there is a Yupiteru MVT 8100 that is the mobile version of the 7100.

That's all I can think of.

I guess there is no more HOT URL for the time being.
Got this among these email messages this morning.
No one wants to upset BIG BROTHER.

1)_____
If you haven't posted the note already, could you hold off
for a day or two until I get this thing a little more
polished? If you've already posted the note, I may block
the protections for a little while.

The AR8000 Hacker

2)_____
Like I said, hold off on announcing the page until I
give you the green light...

Might it be prudent to run this thing by a couple of
other people before posting it?

If so, who would you recommend?

The AR8000 hacker

3)_____
Hmmm, that usenet posting was a little over the top.
I'd really hoped to shop this around first, and perhaps
pass it along to another site. I'm not sure I should use
the work server for this material. So, I've taken the
server down for the time being. I hope this doesn't cause
any problems. Please don't circulate the original with
my name on it.

The AR8000 Hacker

There you have it. A cautious individual, The AR8000 Hacker.
IMHO that is a sign of wisdom also.
He reads these USENET groups. Do not email me inquiring about
this as I respect his/(her?) right to privacy. May I suggest
you post any observations directly to The Hacker here. Maybe there is
someone who would like to host the material that The Hacker prepared.

IMHO it really was pretty good.

BTW Some have complained about URL to 'Squirt Files'.
There seems to be a 'bug ?' in how The Internet Assistant for Winword
prepared the URL's for the new HTML files. Microsoft really does a
pretty good job so this may have been an operator error on my part
when I transfered them from PC to UNIX site. On the PC the files end
in .htm on the unix site they end in .html.

Query can your WWW browser recognize properly files that end in .htm?
It would make my life a lot simpler if all of them do since I can debug
and test HTML on my local PC. If not isn't there a way to point to
a file with a pusedo name in UNIX? (ie if person sends UNIX show me
AR8000.html and UNIX looks at disk and sends AR8000.htm, no sweat?)

The URL to the just released Beta Internet Assistant for Winword is
ftp://ftp.microsoft.com/deskapps/word/winword-public/ia/wordia.exe

It is a great HTML editor/viewer. Thanks MS for the Freebie!
It isn't that great as a WEB Browser, but is there any other PC
Word Processor on the Planet capable of doing what Word can now do
seamlessly?

Why put up with all that stuff. The AR8000 will do what you guys are after
with a little clever programing of the 20 search banks and proper use
of its myriad other features. And you would still have 1000 channels left
for other stuff with full ascii lables. There is no big mystery as
to what BearCat has done with their scanner.

Actually, use the same trick I used on photographic negatives. I used a light clear oil on a toothpick and applied o the scratch. Petroleum jelly worked OK also. Rub off excess with soft tissue. This works well for minor scratches but deep scratches may be a lost cause. Try it, you've nothing to loose.

>they did, in terms of connectors, etc... Right now, I presently just have
>a wire antenna coming out of the screw-in antenna hole, so I'm looking for
>suggestions on the best connectors, etc...

I did the mod and it works fine. I ran shielded coax to the rear of the
pro2006 into a mini-plug jack. That way, I can easily run a mini-to-phono
cable from the 2006 to my shortwave phono antenna connector. Of course,
you'll have to drill a hole in the back of your pro2006.

> Also, I'm wondering what the 2006 with the 455 khz can do that I
>haven't thought of? And if possible, I'd like to get my hands on some
>freqs that take SSB? I know of the ham ones, but I'm curious to know if
>there are others.

Cordless phone frequency inversion is worth a try. Set your shortwave on
SSB and tune around until you get it in the clear. You'll have a 3 KHz
whine noise but the conversation will be in the clear. Another use is to
chase sattellites on the 137 MHz band. Use SSB and listen to the doppler
shifts as the birds approach and depart your area. You mentioned ham, have
you tried the 144 MHz area for SSB?

There seems to be some interest in this mod so I will post a followup
with my version of the 455 HKz mod.

2178. 455 KHz mod for pro2006

Newsgroup: rec.radio.scanner
Date: 1995-02-13 15:22:30 UTC
From: horak@convex.com
Message-ID: <3hntfm$gab@eugene.convex.com>
Source record: 261247

This is the mod for adding SSB capability to your Pro2005/2006. It is taken in part from Bill Cheek's Scanner Mod Handbook Volume 1. As long as you have a shortwave receiver with an external antenna jack and capability to tune to 455 KHz, you can interface it to the Pro2006 with this mod. It is best if you use a static safe work environment to perform this mod and you should have some technical knowledge. Also, a schematic would be helpful but is not necessary.

You will need the following parts:

Output jack (I use a 1/8 mini earphone jack but some like a BNC. The 1/8 mono jack is easier to install because you don't have to drill as big a hole in the back of the unit)

.01 uF capacitor

5 Kohm resistor (1/4 watt)

6 inches of mini coax or other shielded cable

A cable to run from the 2006 to your shortwave. I use the shielded cable that has the 1/8 plug on one end and a phono plug on the other end (1992 catalog Radio Shack P/N 42-2444 works for me). The phono plug is perfect for the antenna input of my DX440 shortwave receiver.

The first step is to remove the cover of the unit and drill a hole in the back of the 2006 for your 1/8 or BNC plug. (You will want to wrap some tape around the drill bit about an inch from the end to keep it from cruising right on into the electronics once it punches through the metal!) Solder the 5K resister to one end of the .01 uF cap. Solder the other end of the cap to the shielded coax wire. Solder the other end of the coax to your 1/8 phono plug (or BNC) and ground the cable at this end. Now that the cable is in place you are ready to connect it to the 455 KHz source which is D33. It is on the top circuit board near the middle left, not too far from a huge capacitor. Solder the end of the resistor to the cathode of D33. (This should be the top of the standup part) Now you can test it out before you put the cover back on to make sure you did everything correct. You should be able to tune to some local airport or CB frequency on your 2006 and receive the same thing on your shortwave (with it tuned to 455 KHz and hooked up to the 2006 of course). If you tune something on your scanner that is SSB, you should be able to switch your shortwave to SSB and tune in the signal just fine. Beware of one thing, since the 2005/6 only tunes in 5 KHz increments minimum, you may notice from time to time that the signal on your shortwave isn't real clear. It may be that you will need to tune the shortwave anywhere from 451 to 459 KHz to tune in the

signal well!

BTW, this mod will work with any receiver's IF section. As always,
I assume no responsibility if you SCREW UP YOUR RADIO!

Reception isn't greast since the USA version of the 43 isn't tuned for
those freqs. Even if it was, there isn't much to scan between 66-88;
at least not for most casual users. I'd do the mod but then, I'm not a
casual listener :-)

There is still some PRO-43 models in some RS stores in Toronto, which has
cell band available. Old stock? Of course RS employees don't have a clue
about scanners, so you have to be familiar with what you're looking for.

Connecticut [US] State Police are testing/ready to implement a system
where they not only know where the SP car is, they can tell if it's moving.
[I know how this is done, so please do not tell me.]

Additionally, belt mounted devices on the Troopers will be able to
id where, in motion or no motion and tell the relative position
of the unit. Interesting for single trooper cases where the trooper
is down and can't get to radio.

|>>Does anyone know of a way to remove scratches on the
|>>face of the LCD panel on handhelds?

|I've used toothpaste to remove scratches from plastic. Toothpaste might be
|better for removing scratches from the case of a scanner though. Careful
|experimentation is the way to go.

I've used the metal polishing stuff called "Simichrome" that's imported
from Germany and probably sold at knife stores... I put a dab of it on
a small piece of lens tissue and go at it... if the plastic material is
REALLY soft, as on the clear plastic front of a toy flashlight, it won't
work all that well... in addition, I've seen plastic scratch removing
polishing compounds at some automotive paint places, but they costed
a couple of bucks per squeeze bottle...

I've seen this toothpaste trick in toy car modeling magazines from
the 1960s, but when I tried it the abrasive material just wasn't of
a fine enough size and left a whitish finish; perhaps this material
has changed?

I don't doubt that the tale is spurious, and Dave Newkirk posted a good discussion of this topic last week, I think in r.r.shortwave. But "reliably demonstrated" implies that someone has actually gone and checked this out in the Congressional Record. Do you have any information about who's done this, and where they published the results? I'm interested in this as maybe the only professional etymologist in the country who's also a ham. :-)}

Look up "Plastics" in your yellow pages. Here in
California we have TAP Plastics, and they sell a
kit which includes 3 grits of liquid polish and
some paper rags to use with it, to take out
scratches. I've used it to restore clarity to a
heavily fogged plastic lens on my compass (the
pastic got fogged when I glued it back in after
it fell out). The kit is cheap, and is designed
to work on different plastics.

>with maybe 20W if the pagers had good antennas and receivers, right? I
>live in an area with few paging towers, so this doesn't really affect me,
>but don't most paging companies use too much power for the application?

Not really. As someone that maintains a 900 Mhz paging system I can tell you that the users want their pagers to work everywhere - basements, bank vaults, submarines... wherever. 900 MHz systems usually run about 100 to 500 watts ERP in order to provide desired coverage.

I don't know if you're a pager user, but unless you want to walk around with a 4 inch whip sticking out of your head with low loss cable running to the box on your belt, they perform fairly well. Some pagers are better than others. We have some of these thin credit card pagers (I think NEC makes them) - and they suck. Motorola Advisors, Bravos, and some of the Dimension series units are pretty good - but they're bigger - that means more antenna.

The real problem with paging interference on a scanner is likely the scanner itself. Front ends that are too easily swamped by strong signals. Face it, how selective can a scanner's front end be if you want frequency coverage from DC to light. I would imaging that the scanners with high IFs are better at rejecting this type of stuff.

2210. Austin Condor Antenna Info

Newsgroup: rec.radio.scanner
Date: 1995-02-14 04:36:36 UTC
From: johnv@teleport.com
Message-ID: <3hpc0k$5c7@desiree.teleport.com>
Source record: 261280

Does anyone know anything about the austin condor antenna for scanners?

I have a handheld scanner, and I use a radio shack telescoping center loaded whip. It is made of aluminum. This is the only antenna that I can get good performance with -- the supplied rubber antenna works, but its performance drops especially in the lower frequencies.

Does the condor give good reception? I am interested in the rubber flexible one. I would like to find a flexible antenna that has good reception because this long telescoping whip is a hassle and also might break my BNC connector.

Thanks!

johnv@teleport.com

Message-ID: <eddie.17.00DDA8D1@primenet.com>
Source record: 261281
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I have a BCT-7 sitting on my desk. So, I'll try to answer some questions.

1. Yes, it is pre-programmed with all states. The problem then is what frequencies. Mine seems to have the bulk of the frequencies I look for left out. I live in L.A., so there are tons of frequencies, most of which I found on other scanners. You can make up for missed programming by using the 25* user freqs. I say 25 because that is how many you can program per band. The 100 advertised is slightly misleading.

2. It does work fine. It is nice to have on the road. For a base/home unit look elsewhere.

3. If I had it to do over, I probably would have saved the $170 for a later purchase.

Eddie

Well, now I'm following up on my own posts... :-)

A call to Uniden today revealed that yes, it is pre-programmed for all
the states. However, what the tech said was that "it was pre-programmed
for all the *popular* police freqs..."

I wonder if there is much room for error there...

Request information from Bearcat BC120XLT owners:

1. Quality of product
2. Ease of use
3. Other miscellanous things that you feel might help.

I'm in the process of thinking about purchasing above model, as it
has most of the features that I want; i.e., 100 channels, no 800 band.
Being a railfan, I really don't need the 800 band, and there's EXACTLY
100 main frequencies for the railroads.

E-mail all replies to:
doctorfu@prairienet.org

Snail mail all replies to:

>
I recently asked about modifable RS scanners to a shack person and was told
the following. RS will fire and fine up to $4,000 any salesperson who tells
how to or where to go to get a scanner modified. I would tend to believe
that RS could not impose the $4,000 fine as the mod is not illegal under
Canada's laws... Once they fire you they could not expect to collect the
fine and Canadian law will not support the claim. But RS has scared it's
staff any way...

Compared to the older Nissei scanners (particular its predecessor the
AR1500/e/ex) it's a great improvement in ergonomics and, to some degree,
performance. Compared to rigs like the AR8000 or MVT-7100 it's primitive.

The Condor does not have a tuned element for VHF-lo, so you'll still do
better with the whip. However, since it is large, it does better than most
duckies on the low band.

There is a serious RUMOR that there is going to
be a terrorist attack here in the USA from the Islamic
terrorist groups next month. They are mad at recent blows
from US legal system.

What frequencies do you think one would want
to 'squirt' into their scanner to hear the US
responce to such actions?

AR8000 format ones can be sent for posting on
AR8000 site. Credit always posted as to author.

Do you think New York is the only target?

What frequencies do you think the scumballs will
use or aren't they that sophisticated in your
opinion? Remember IRAQ is said to be behind them in funding
and they might buy some high tech equipment.

How about sw frequencies? Any clandestine conversations?
Where?

The author pulled his text, having second thoughts. He killed the site
for the time being.

I am going to make the info available at my site after consulting
with a few others to make sure I won't get burnt for it.
I also have to verify if it is ok with "The Ultimate Hacker?"
It really is pretty neat and esential to hacking the ar8000.
I already figured much of it out myself but he really
wrote better then I could.

I know of three seperate folks that have figured out essntially the
same things. This fellow "The Ultimate Hacker?" figured out
a little more then I was aware of. For instance I know where
I am going to put 64 bytes that will burn anyone who
steals my radio!

>Is there anything that meets this requirement?

>I stoped at Sam's Club and saw three cdroms
>$36 Deloran Travel Planner
>$39 Ran McNalley Cdrom and travel Atlas
>$59 Deloran (spelling?) Streets of USA.

The DeLorme Street Atlas USA v 2.0 is the best of the programs cited. It will not do what you want to do, however. The other DeLorme program is even less capable. I am not familiar with the Rand McNally program, so I can't comment.

Once you have purchased Street Atlas USA, you can immediately send it along with a check for $105.00 to DeLorme and get their product called Map Expert, which is a greatly enhanced version of Street Atlas. DeLorme sells a GPS front end that works with this program that can be made to display a moving map on a laptop computer when hooked to a GPS receiver. It might be possible to write a program to do what you want to do. This offer is good only until the end of February, so you must take action immediately if you want to get this tremendous offer. The retail price for Map Expert is $495. DeLorme sells it for $295. The upgrade offer allows you to get it for $165. There are a number of us here in Central Texas who have ordered this upgrade. Some already have the system working in their vehicles.

As far as I am concerned, DeLorme is the only game in town for affordable mapping. Better stuff may be available, but it probably costs a fortune.

If you want additional information and methodology, drop me an email to rodcole@cole.com and I will keep you posted as things develop.

>I have a HP DJ550C to print any maps out in color.

This shouldn't be a problem as Map Expert is a Windows based program.

> >The BCT-7 is an odd scanner -- better suited for sale at
> >truck stops than by dealers catering to scanner hobbyists.

> Hmmm... oddly enough, that's exactly where I saw it! :-)

I'm trying to tell you the BCT-7 (and all other Uniden scanners) are downright funky. They sport loads of bells, whistles, fruit loops, bubble gum, and dog biscuits. You don't find meat 'n taters in Uniden products anymore. Used to, you could. Not now.

Now you get it all on a chip.....where software, properly called firmware resides. Chips are not hardware....not unless there's a lot of them along with a lot of peripheral stuff.

The BCT-7 is designed for truck drivers and yuppies who don't know any better and don't have anything better on which to spend their money.

Best way to learn this, though.....is BUY ONE. <grin>

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA. It
tells where you can buy your first scanner, what features
it should have, where to get it repaired if required, how
to get frequency information, and mentions a few scanner
clubs worth joining.

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, armored cars, trains, taxis,
airplanes, and buses are all equipped with radios and you
can listen to them. You can monitor the local sheriff and
fire departments to hear about events "as they happen,"
before the news reporters hear about them. Hostage dramas,
bank robberies, car crashes, chemical spills, tornado
sightings are all fair game. In a single afternoon, you
can hear a high speed police chase, Drug Enforcement agents
on a sting operation, and undercover FBI agents as they
stakeout a suspect.

How about listening to a presidential candidate discuss
strategy with his advisor from a 415 MHz radiophone in Air
Force 1, or a team of G-men protect him while transmitting
in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you
can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road
crews, snow plows, and traffic helicopter pilots.

Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

You can even listen to the order taker's wireless microphone at the local McDonald's restaurant on 154.6 and 35.02 MHz!

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. A new law outlaws listening to cordless phones, too, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the laws.

It is now illegal for companies to sell recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a 39 page paperback, ANARC Guide to U. S. Monitoring Laws, compiled by Frank Terranella, available for $9.95 + shipping from Grove Enterprises, PO Box 98, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners bear the Realistic label but are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 40 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often poor.

Deluxe scanners can be controlled by a personal computer, although this feature isn't important to many scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are undesireable due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly

reduces image reception.

Currently, the more popular scanners include the Uniden/Bearcat BC760XLT (a/k/a 950XLT) and discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, and Radio Shack PRO-43 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The new Uniden replacement models, the BC9000XLT and BC3000XLT, work very well and are my current favorites.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 has recently been replaced by the 1000 channel PRO-2035. The portable Radio Shack PRO-62 is a good performer. All three models employ up conversion and are made for Radio Shack by GRE (General Research Electronics). Both GRE and Uniden make scanners for Radio Shack.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a spring shaped antenna, covered by rubber. Although it is small and tolerant of physical abuse, the range of a heliflex antenna is very limited. Augmenting it with a 19" telescoping metal antenna can improve portable reception greatly.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to lightning strikes because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because it they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch

cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Wal-Mart, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200. | Telephone (orders only): (800)438-8155.

- National Tower Company, PO Box 15417, Shawnee Mission, KS 66215. Telephone (913)888-8864.

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Marymac Distributing (Katy, TX) sells Radio Shack scanners at discount, but charges a 20% restocking fee for returned merchandise. Telephone (800)231-3680 and (713)392-0747.

- Scanner World (Albany, NY). Telephone (518)436-9606.

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Many ham radio dealers, like Amateur Electronics Supply (Milwaukee, WI, (800)558-0411), also sell scanners.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

If you are handy with a soldering iron, you may be interested in modifying your scanner to add features or enhance its performance. Be warned this usually voids your warranty. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

ftp.cs.buffalo.edu
garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and stocks parts for several older models. G & G sometimes buys old scanners, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $25. A new 3rd edition is expected in early 1995. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes

and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's 168 page Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 9th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and Kneitel's sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. It will likely disappoint experienced scanner hobbyists and is better suited for beginners. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. It works well.

Grove enterprises sells FCC license information on CDROM for $100. The fields are similar to PerCon's Spectrum

CDROM, but the transmitter and licensee location are intermixed which makes query results confusing. The first release has problems with mistakes in the data and documentation, and I look forward to a new release to correct these shortcomings.

Over 15% of the FCC licenses, including many fast food restaurants, contain transmitter latitude and longitude but specify no transmitter city. To determine the location of those transmitters requires using the latitude and longitude information.

As I have already done for dozens of radio enthusiasts and companies in several states, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, | and produce a custom report. To make it easy to locate | transmitters, the report includes a color map marked with | transmitter sites. I call this new innovation RadioMap(TM) service. It allows you to identify antenna sites (including paging and cellular phone cell sites) and | visualize the transmitter locations in your neighborhood, near your office, at an airport, and other places of interest -- from VLF through microwave.

This is completely different from, and independent of the | Grove Enterprises CDROM. See Feb. 1995 Monitoring Times page 101, or RadioMap reviews on page 2 Feb. 1995 RCMA Scanner Journal and page 36 Jan. 1995 AOSC's American Scannergram.

Ham radio stations are not listed. The RadioMap report | includes frequencies, callsigns, and licensee names. I | will choose the range, depending on transmitter site | density. In rural areas, ranges of up to 8 or more miles | are possible, while ranges of 1/2 to 3 miles produce best results in urban cities.

I will produce custom RadioMap reports for areas in any of | the 50 states. Send $19.95 (check or money order) for each | RadioMap report, your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM central time.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio users to identify their operations with their assigned call letters, most ignore the regulation. This often makes it difficult to know who

is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's

"search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $24.00 per year, which includes the monthly RCMA Journal, which consists of approximately 95 pages. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

AOSC questions can also be sent electronically to:

rccons!aosc_hq@telerama.pgh.pa.us or
dave.marshall@f240.n108.z1.fidonet.org.
FidoNet: 1:108/240.0

AOSC also has a MEMBERS & EDITORS Scanner related echo, AOSCNet, distributed via FTN on 6 BBS systems, and via Internet Mailing list. For info on the ECHO only, contact:

R.E. Christian, AOSC PA/AOSCNet Founder
PO BOX 12763,
Pittsburgh PA 15241-0763.
FAX: 412-831-5860.

Internet: rccons!aosc_pa@telerama.pgh.pa.us
rccons!aoscnet_hq@telerama.pgh.pa.us
rick.christian@f220.n129.z1.fidonet.org
FidoNet: 1:129/220.0

To receive a file of info on the All Ohio Scanner Club via Internet send to: rccons!ftpmail@telerama.pgh.pa.us

In body: get aoscinfo.zip

This will send a UUENCODED info packet to you. The file contains an outline of the material you will find in the American Scannergram, the AOSCNet, and an application for membership. (Note: This file will not be sent back to *.fidonet.org addresses.)

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, most at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $15 check, payable to Kim Moran, to:

The Command Post
attn. Kim & Ted Moran
6143 W. Touhy Avenue
Chicago, IL 60646

Some CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (708)852-1292.

Here is a tentative meeting schedule for 1995. All meetings will be held on Saturdays at locations announced in advance.

February 18, 1995 - Westmont Police Dept.
April 15
June 17
August 19
October 14
December 16

Bring a notebook and your appetite.
--

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

I am often asked, "How do you find these frequencies?"
Scanner enthusiasts can obtain frequency information from
several sources, including books, government microfiche
records, or other listeners.

Books

The most convenient source of fire and police frequencies
is the Police Call Radio Guide, published each year in 9
regional volumes by Hollins Radio Data, and sold at Radio
Shack and larger book stores for under $10. Police Call is
basically a computer printout of FCC license information in
the fire, police, local government, and conservation
services in two lists: by licensee name within state, and
by frequency. Later editions have included a few pages of
local airport and nonsensitive federal government
frequencies.

I highly recommend Richard Barnett's 1992 book, Monitor
America, published by Scanner Master Corp., and available
from Grove Enterprises for about $25. This second edition
is crammed full of police, fire, local government, news
media, sports, national park, and commercial broadcast
frequencies for all 50 states. The information was
compiled mainly from members of the world's largest
scanning club, the Radio Communications Monitoring
Association (RCMA). Monitor America contains detailed
communications system profiles and precinct maps for major
metropolitan areas. Police and fire radio codes and unit
identifiers unique to local agencies are listed for several
cities. This differs from Police Call, which gives a more
sterile, but uniform treatment of licensees, listing even

the smallest of towns. A 3rd edition is expected in early 1995.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Beyond Police Call, available from several sources including Radio Shack, covers the business, schools, and other stations not covered by Police Call, its sister publication. One volume covers the entire USA, but no call signs are shown.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The second edition is about 400 pages and is available from Official Scanner Guide. The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $100 instead. The fields are similar to PerCon's Spectrum CDROM (see below), but the transmitter and licensee location are intermixed which makes query results confusing. The first release has problems with mistakes in the data and documentation, and I look forward to a new release to correct these shortcomings.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. It works well.

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

Over 15% of the FCC licenses, including many fast food restaurants, contain transmitter latitude and longitude but specify no transmitter city. To determine the location of those transmitters requires using the latitude and longitude information.

As I have already done for dozens of radio enthusiasts and companies in several states, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, | and produce a custom report. To make it easy to locate | transmitters, the report includes a color map marked with | transmitter sites. I call this new innovation RadioMap(TM) service. It allows you to identify antenna sites

(including paging and cellular phone cell sites) and | visualize the transmitter locations in your neighborhood, near your office, at an airport, and other places of interest -- from VLF through microwave.

This is completely different from, and independent of the | Grove Enterprises CDROM. See Feb. 1995 Monitoring Times page 101, or RadioMap reviews on page 2 Feb. 1995 RCMA Scanner Journal and page 36 Jan. 1995 AOSC's American Scannergram.

Ham radio stations are not listed. The RadioMap report | includes frequencies, callsigns, and licensee names. I | will choose the range, depending on transmitter site | density. In rural areas, ranges of up to 8 or more miles | are possible, while ranges of 1/2 to 3 miles produce best results in urban cities.

I will produce custom RadioMap reports for areas in any of | the 50 states. Send $19.95 (check or money order) for each | RadioMap report, your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM central time.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA)1. Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'2.

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are collected annually, which covers a monthly newsletter, the RCMA Scanner Journal, about 95 pages long. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. A recent liberalization of club policy now permits the printing of most federal law enforcement frequencies, e.g., Secret Service, FBI, Customs, and DEA.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542
Silverado, CA 92676
USA

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

The real challenge is deriving new spectrum usage information. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

More about sleuthing will be discussed in Part II of this article.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?
Part 2: Sleuthing

by Bob Parnass, AJ9S

Part I of this series discussed how scanner enthusiasts can obtain frequency information from books, government microfiche records, or other listeners. This installment discusses digging up new frequencies on your own.

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto

terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described in Part I of this article, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals

weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

Reception is going to be pretty much line-of-sight at 470 MHz. You
might be out of luck having a mountain in your propagation path.
All is not lost, however, since you're close to the city. You might
experiment with a directional antenna and seeing if there is usable
signal from reflection or scatter. A cheapo outdoor UHF *television*
antenna comes to mind. Try pointing it in various directions, towards
a nearby tall building, or perhaps even away from the city.

Good luck--hope this helps!

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

Anybody with enough money can buy a brand new scanner, but you can save lots of money if you get a good deal on a used scanner. Hamfests are probably the best place to find used radios, but you must be familiar with the equipment. Hamfests are repleat with older radios you won't see in today's catalogs.

At last count, there were over 70 scanners and monitor receivers of various brands in my collection. I purchase most of my receivers at hamfests or horsetrade with other radio hobbyists. This article describes a few of the FM receivers in my collection, and is not meant to be complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Several people have been pleased with Electronic Repair Center, in Franklin Park, IL, which repairs scanners for a flat fee. Call them at (708)455-5105 to find out their current rates. G & G Communications (telephone 716-768-8151) is another scanner repair company. This family owned company repairs scanners and stocks parts for several older models. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar

Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series. Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Bearcat BC-101, Radio Shack COMP 100, and Tennelec MCP-1, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The SBE Optiscan (and its Sears clone) required poking a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older | scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

Radio Shack scanners contain a reasonable number of features. All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. A few years ago, the Regency and

Bearcat scanner lines were purchased by Uniden, a Japanese company, and production was moved to Asia.

My favorite VHF/UHF receivers are the 300 channel Radio Shack PRO-2004, the newer 400 channel PRO-2005 and PRO-2006, and the ICOM R7000 and R7100. The ICOM models are more "communications receiver" than a conventional scanner.

Other favorites include the Bearcat 300 and 760XLT, Regency M400, and the Regency K500 (predates the M400), all of which include a "service search" feature.

For portable use, I prefer the Radio Shack PRO-43 and Uniden/Bearcat 200XLT.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

ICOM

R-7000: At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the Icom user with a very annoying clickety-clack, clickety-clack!

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be

installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but has better IF filtering and contains front-end circuitry for VHF-low, VHF-high, and UHF bands. No aircraft band coverage. Three crystal filters. Front mount speaker sounds good. No rescan delay.

Bearcat 12 (Electra): One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

BC101 (Electra): First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC220 (Electra): 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC20/20 (Electra): A BC220 but with 40 channels. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store

feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite.

BC350 (Electra): 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

800XLT (Uniden): 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives

10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels.

BC100XLT (Uniden): Excellent 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): Excellent 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The

most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Radio Shack

PRO2004: Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio.

PRO2005: Radio Shack's top of the line scanner for 1989 and scanner of choice. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although there is no mobile mounting bracket available and the keyboard is not backlit. More

sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended.

PRO2006: Radio Shack's 1994 top of the line scanner. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended.

PRO34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners. |

PRO2022: Base/mobile scanner. Like the PRO2021 but | includes the 800 MHz band. Cellular images throughout the | 847.6 - 869 MHz range. Includes power saver circuit, odd | for a base unit, which can clip the first part of a | transmission.

PRO2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO2003 hard to operate unless in a well lit

room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO24: Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar:

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off

frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2526	10	X		yes	yes
FR2526	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorla Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. The Plectron 500 series is less desireable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Parts for Plectron receivers are available from:

I have both & if you have to choose ONE, go with the 2006. My 51 seems to be much more sensitive at picking up cell phones, but sucks on cordless. The freq range is a lot more limited than the 2006 also.

Radio Shack's warehouse in Westminster had some flooding and right now they have a huge tent sale in their parking lot. Most of the stuff has damaged boxes but the insides are dry. I picked up the RS-2036 scanner for $159. They had about a hundred more of them.

They had tons of amps, speakers, stereos, some computers, mixing boards, PA stuff, Shortwave radios.

This lot is located on Knott St. just north of the 22 Fwy.

Instead of a detector, why not kick in a few extra hundred dollars and
get a jammer?? The ARC Interceptor is $600 and will jam X and K. A
detector is no more than a ticket alarm. I just wish I had $600.

Go to a plastics supply house and get some Novex plastic polish. It has a
very mild abraisive and will take out all but the deepest scratches and leave
your LCD panel looking like new. Follow the label instructions.

The main problem we scanner users in the UK have is Big Brother.
We have mags like Short Wave Radio, but they DON'T give actual freqs to listen to. Monitoring Times recently had an aticle on the US govenmrnt HF radio service and listed freqs to listen to and even suggested that the operators might like to receive RST reports!
If a mag in the UK published actual requencies they would be closed down overnight. They can publish "bands" but not spot frequencies.

And scanning is really a "localised" hobby (as is the want of VHF) so localised scanning news groups seems logical.

A generalised group OK, but specific as well. Please?

>> I VOTE for this one!
>>
>> It would be good to see scanning from another area than USA.
>I add my vote. I've recently gotten copies of a british scanner magazine
>called shortwave magazine and it is far superior to our monitoring times
>and pop com. The advertisements are also interesting because they show
>numerous scanners that we in the U.S. have never heard of.

boice933@129.101.119.223 typed:

: I'm still curious myself about mods (since I only bought it a week ago), but
: here are the frequencies, as extracted from the op guide:

806 - 956

This band is broken up into at least three sections. That is, there are holes where the cell phone freqs. are between 806 and 956 MHZ. It really sucks! But it is still an excellent scanner for the money. It cost me $212.00 last summer ('94) in upstate NY. This may be more or less in other areas of the nation, but it was worth it since I am a volunteer fireman when I'm not at college. I recommend this scanner to anyone who is just casually into the scanning thing and does not want to blow big bucks, but still wants up to 300 channels per second (on search mode @ the 27-170 MHZ range), 100 programmable channels, and lots of other neat features that would probably cost much more. I'm no expert, so don't take this as a matter-of-fact review. Just my $.02!

Ben Lerman
lerman@umr.edu

2259. Poughkeepsie, NY 800 MHz frequencies

Newsgroup: rec.radio.scanner
Date: 1995-02-15 08:44:01 UTC
From: chestergeo@aol.com
Message-ID: <3hsesh$ge@newsbf02.news.aol.com>
Source record: 261129

From a local Radio Shack, the new 800 MHz trunked frequencies
for Poughkeepsie:

852.6125
807.6125
852.6875
807.6875
853.2625
808.2625
854.4125
809.4125
860.7125
815.7125

Presently, it appears that the town police, town highway, and city
fire departments are using the system. The city police and DC
fire are on their regular frequencies.

IMO, you're in over your head.

Sure, there are obnoxious jerks among the ham radio community just as there are anywhere else. I've found them to be very much the minority, but they do tend to stand out.

Your comment above is quite ironic, given that packet radio networks were made a practical reality on the ham bands. At least now I know why amateurs put their own communications satellites in orbit - to make free long distance phone calls.

The update to my Access database has been posted on Vic's WEB page. If you point to my previous entry, you will get the updated database (the -2 version)

For those of you who don't have any idea what I'm talking about . . .

I've posted a freeware database for the AR8000. The database is written in Microsoft Access 2.0 and requires that you have Access on your computer. It can import and export data from the AR8000 by using text files (standard "squirt" or "MX" format). It maintains a frequency table with all your thousands of "finds" and dynamically links it to the AR8000's memory channel assignments.

Try it and let me know what you think!

>Just would like an opinion from all scanner buffs. What is your dream scanner?

Well you asked so here goes:

A scanner that will:

1) "follow" trunking.
2) 1000 channels with a scan rate of approximately 1000 channels per
second scan rate.
3) able to monitor several channels simultaneously. This would be
great for monitoring trunked freqs.
4) skip the Motorola anti-scanner data bursts and the end of
transmission anti-scanner tones.

Cheers

Brian

From "SpeedtrapS" by Tomerlin & Whitledge;1994 Edition

Is Mobile (use in vehicle) Use of Scanners Legal:

Iowa; YES: Legal
Wisconsin; YES; Legal
Illinois; YES; Legal

Indiana; NO; Illegal State Law 35-44-3-12. Licensed Radio Amateurs
Exempt.
Actual possession of the unit is illegal. Must have permit.

Hope this helps.

2272. Re: Med frequencies...

Newsgroup: rec.radio.scanner
Date: 1995-02-15 18:53:02 UTC
From: apu@menger.eecs.stevens-tech.edu
Message-ID: <3htiie$33l@apocalypse.dmi.stevens-tech.edu>
Source record: 261142

The "Med channels" are allocated as a group of twenty frequencies, though only channels 1-8 (16 freqs.) compose the telemetry channels. Telemetry refers to the practice of sending EKGs back to the hospital via radio.

Generally, these eight channels are assigned by the dispatcher as needed (your "Go ahead on Med 5") for either the duration of the call (on-scene time to arrival at hospital) or in busier systems for just the few minutes the EMS units wish to speak with the doctor.

|> Every now and then I'll hear a mobile unit request and
|> receive permission to communication with a hospital, and
|> the dispatcher will say something like "Go ahead on Med 5"
|> or some other number...but I neve hear anything else on
|> any of those frequencies.
|>
|> How are those other frequencies used...both in theory and
|> in actual application elsewhere? Is this partly a reception
|> problem for me, or is there really likely to be very light
|> traffic on those frequencies in this area?

The mobiles transmit at a low power level on 468 MHz, and this is repeated in the truck, again at a relatively low power level. The signal is picked up by one of many radio towers scattered about the units coverage area and relayed to the hospitals via telephone. Because of the low power levels, you can expect to be able to receive (with a scanner) the mobiles for about 1/2 mile. On the other hand, you should be able to hear the doctors on 463 for a good distance.

In case you are interested, a computer in the dispatch center is told what channel a unit is assigned to, and turns on the nearest radio tower to the unit and connects the hospital's console to the tower via phone. The doctor never has to pick what radio frequency to use or change to the frequency the unit has been assigned for this job.

The other two channels (09=462.5500&467.9500; 10=462.9750&467.9750) are usually used as talk channels between dispatch and the mobile units--a way to keep non-emergency traffic off the dispatch frequencies, and, due to the limited radio range of the mobiles, a way to convey information that while not confidential is not public (ie, food orders, call XYZ, etc.) It also often used in busier systems as secondary. limited function dispatch channel. Usually an agency will use Med 09 or Med 10 both not both, though some use one for dispatch type communcations and the other for patient report type comm. Since Med 09 and Med 10 are not real med channels, some systems also connect them to regular repeater systems so you can easily hear both sides.

|> For that matter, some hospitals and ambulances in this region are
|> still on 155.220 and 155.340. For whatever that is worth!

At least in New Jersey, the 155.xxx frequencies are probably the most popular
for EMS dispatch, mutual aid, etc. Specifically,
for dispatching: 155.160, 155.175, 155.205, 155.220, 155.235
155.265, 155.280, 155.295, 155.385, 155.400
for mutual aid: 155.280, 155.340, 153.725, 153.785 *
for pt. reports: 155.340

*-The 153.xxx frequencies are SPEN 3 & 4, used mostly by EMS & fire.
(SPEN = Statewide Police Emergency Network)

**-JEMS 1 is the ALS dispatch frequency (varies from area to area)
and JEMS 2 (155.340) is used for patients report and mutual aid.
JEMS 3 (155.280) is used for dispatch and mutual aid and JEMS 4
is the same as SPEN 4. (JEMS = (New) Jersey EMS)

Of course, many agencies are dispatched on 3x.xx and 4x.xx MHz, other
15x.xxx frequencies (often FD or PD channels with paging), 4xx.xxxx
(again, most FD or PD channels with paging) and less common 800/900 MHz.

Eyeglass Manufactures & Dental Labs use a compound to polish the plastics they work on. I picked up some polishing compound for plastics at a large hardware/hobby store. The brown compound from the hardware/hobby store polished smooth, but left a dull finish. I suspect it was course. I obtained some of the white polishing compound from a dentist, and applied that with a cotton ball to get a very nice shiny surface.

The manual that comes with the radio doesn't provide much information.
I can tell you that it is triple conversion and there are UHF TV images
455 MHz higher than the actual frequency. The front end is wide, like
most scanners but the Yupi is not as prone to intermod and overload as
other scanners I have seen.

There are 5 different battery save functions :-)

2280. Monitoring AM radio listenership

Newsgroup: rec.radio.scanner
Date: 1995-02-16 03:44:49 UTC
From: sulzmanj@peak.org
Message-ID: <3huhnh$hpv@gaia.ucs.orst.edu>
Source record: 261151

This is a request for information and assistance. I�m part of an Oregon State University project using low power AM radio (travelers� information stations) to reach car commuters with information about Oregon forests and forest management. We have three TIS transmitters up and running in various locations, each broadcasting 10 watts at 1610 kHz.

Our challenge is to evaluate the project, including determining how many listeners we have and when they listen. Easier said than done. But an article in the September 21, 1994 issue of Radio World describes a �new electronics rating system� developed by Trendata Corporation to monitor radio listenership that could help with our evaluation. It uses computer/scanner technology. Here�s an excerpt from the article:

�We put together a computer program which acts kind of like a Bearcat scanner,� explained Earl Baldwin, the marketing director of Trendata of Mesa, Ariz. �As all the cars go by, it rotates the FM signals with 10.7 MHz added onto it. When it locks onto a signal, it records it, the station, frequency, time and location. Then it releases it and searches for another.�

The article goes on to say that �the nature of the technology excludes AM and stationary listenership.�

The technology sounds perfect for our application. But can a similar technology be built (fairly inexpensively) to monitor AM listenership? How would one go about building such a device?

Please respond directly to me. Thank you in advance for any assistance.

Bill precisely what a security expert wrote me regading captured
hardware.
I did note that Newsweek said the last terrorist just taken had a
"radio control' model car ladden with explosives.
I wonder if he got the idea from the James Bond movie?

One defense would be to scramble rc freq and continously jam them with a low power
transmitter reaching only 1/4 mile or so. May set off device before it gets too close.
Might mess up some innocent, though your firm would be safe.

Some other, more crucial 7100 questions:

Is it legal to buy any version of the 7100 in the US?
Is it possible to import one legally from another country?

What laws are you in violation of (if any) if you buy/import a 7100 in
the US?

: ********** New 43-49MHz Cordless Phone Allocations **********

: NOTE: Channels 16 through 25 are identical to the old 10 channel system.

Thank you! New question, has anyone actually *seen* or *heard* and phones using the new extra frequencies? Right now, its easy to do a 46.61 to 46.97 mhz search, with the new ones, I need to allocate 25 channels to make sure I catch all. I guess including the kiddie talkies, that's 30, and thrown in 10 for fast feed and department stores and I just filled another 40 channels.

I'd love to know which models of phones support the added 15.

2287. TR-2400 owners...

Newsgroup: rec.radio.scanner
Date: 1995-02-16 04:54:24 UTC
From: dbaker@tiger.lsu.edu
Message-ID: <3hulq0$ij9@tiger1.ocs.lsu.edu>
Source record: 261158

While messing around with my Trident TR-2400 scanner,
I found a couple of interesting things. Maybe you could
help me figure out what they mean...

My notation:

USER: this is they key sequence the user inputs to the TR-2400
DISPLAY: this is what the TR-2400 puts up on the display in
response to the users commands, actual display in "".
key1 , key2 means hit key1 then key2

1) USER: PROG , MODE , ENT
DISPLAY: goes blank then flashes "CH.Err"
USER: SCAN (before unit goes back into manual mode (ch.000))
DISPLAY: (may differ on unit) "868 ch CH.Err" (even if there
is something programmed in ch 868)
DISPLAY: unit then goes into a manual mode where there is no
frequency present, but the signal meter reads full.
But the distinctive part of the display is "TRX"
that appears right above the up/down arrows on the
left side of the display.

2) USER: while holding down 2ndF hit STEP
DISPLAY: the word "TONE" will appear between the
"PROG" and "DELAY" markers at the top of
the display.It doesn't seem to have anything
to do w/ the keypad beep.

I don't know what any of this means, if anything. But possibly,
they could lead to a software hack to reclaim the cellular
channels. But I can't think of what "TRX" might mean.
Please let me know what you think...
Dave

2293. Need Help: Tuning BC 855XLT ?

Newsgroup: rec.radio.scanner
Date: 1995-02-16 13:47:21 UTC
From: robbino@primenet.com
Message-ID: <robbino.3.000545F4@primenet.com>
Source record: 261175

I am new to this newsgroup, so please bear with me.

I have a BC 855XLT scanner that seems to have lost some of its ability to receive frequencies. I am not able to receive the frequencies that I was once able to.

Is there some way to tune this scanner? . . . to make it more sensitive?

Thanks.

e-mail robbino@primenet.com

2294. SATCOM

Newsgroup: rec.radio.scanner

Hi folks,

I recently mailed the poster of an article on this subject,
asking for a copy of his freq list, now it looks like we'd have more
luck bringing it back into the newsgroup, so here goes.

==========

REPLY-TO: NCarrigan@aol.com
****
Julian,

Sorry - I'd love to fill your request, but for some reason, AOL will not
let me send a file through e-mail to someone on the internet -- only to
other AOL members... that seems really stupid, but for some reason they won't
let me. I'd put it up on the newsgroup, but I don't know how to do that
either. If you know how, let me know...

Nick

.....

REPLY-TO: NCarrigan@aol.com
****
Oh, btw, SATCOM is a military satellite system that is operated by all US
military agencies. It consists of 4 satellites that at most times operate
un-scrambled. Now, obviously, during some war-time or highly secret mission,
all comms are scrambled... but there are some general broadcasts that are put
out to ships, aircraft, etc... If you've ever heard of an EAM (emergency
action message) ... it's very similar to that. Sort of a world-wide
messaging system. It's operated in the 250-265 Mhz range... I'm trying to
find out if the signals are FM/AM or AM SSB. So far, I haven't any luck. I
think they're AM SSB transmissions, but I can't confirm that.

Just in case you're getting excited, it does take a lot of equipment to
get these signals. A really good outside antenna (such as a beam) with a
preamp, and then obviously a descent radio. If I'm right about the SSB
part, then most scanners like the 2004/5/6 can't get them, without setting up
the 455 khz interface to a shortwave radio.

Nick

.....

REPLY-TO: julian@kesteven.win-uk.net

Thanks for trying, Nick, I've had no experiece of AOL, so I can't
help you. I suggest you ask this question in the newsgroup.
someone should have an idea. Anyway, thanks also for explaining

which signals you were referring to. I have a list of those frequencies, split between AFSATCOM, MARISAT, FLTSATCOM F1, FLTSATCOM F2, and FLTSATCOM F3. All transmission modes are give as narrowbad FM. If, as you say there are only 4 satellites, then maybe MARISAT is used for a different purpose. Any ideas? The MARISAT listing I have gives 21 channels, with a pair of frequencies for each. I guess one is uplink and one downlink. The MARISAT frequencies I have are:

Sat Channel downlink? uplink? step mode

MARISAT 1-21 248.850-249.35 302.450-303.050 25kHz NFM

Do you think it's worth transferring this discussion to the newsgroup, to get a wider viewpoint? I CAN transfer files both to email and usenet, so I can transfer all this to the newsgroup if you wish.

Regards,
Julian.

.....

REPLY-TO: NCarrigan@aol.com
****
Sure if you want, be my guest. I'm referring to the FLTSATCOM stuff
mainly. I haven't the slightest idea what the other one is you mentioned.
Is that a foreign military satellite?

Nick
==========

well, everyone,

that's it so far, firstly, can anyone tell Nick how to mail or post files through AOL?

also, please feel free to post any info on AFSATCOM, FLTSATCOM and MARISAT (whatever that is!). anyone know their orbital details (geosync? heliosync? hi-eliptic?).

Regards,
Julian.

From: sternk@alumni.cs.colorado.edu
Message-ID: <3hvrk4$sia@csnews.cs.Colorado.EDU>
Source record: 261165

To all those who responded to my request for information on the Motorola GP-300 radio and its possible frequency range, thank you. I found the frequency for their Channel 1 (469.0125MHz).

I was starting to despair as I approached 470MHz in my search but it finally paid off. :-)

They've just installed a new card access security system in my building. I now know just how well it is really working (not).

Along the way I also found the frequencies for some of the bicycle couriers around here; something else I've been wondering about.

Again, thanks for all the help. I'd have been seriously lost without it.

~Ken

Most car alarms these days operate fairly close to 300mhz AM. I can imagine
yours could be fairly close to that. Most garage door openers are also on
the same frequency.

My two cents,

Just purchased an AR8000 from Lorenz Radio, up in Ontario
Canada. 514-392-9200. It has no gaps, and is on it's way.
The answer is yes, you can get a cellular capable scanner
in Canada. By the way, I talked to Mr. Helmut Lorenz
himself. Very helpful, very knowledgeable. No muss, no fuss.
Call them if you are serious about buying. They did not have
to modify the AR8000, they are actually selling the European
version. However, I will have to reprogram the channel
spacing to match FCC, not Europe's freq plan, since it's
not a US scanner.

My guess is that Radio Shack is distributing cell-blocked
scanners in Canada cuz it's easier for them, not because
Canada forbids it (which it apparently does not).

Mike

>
>Sure, there are obnoxious jerks among the ham radio community just as there are
>anywhere else. I've found them to be very much the minority, but they do tend
>to stand out.

That may be it; I had returned to the 'net after a long hiatus and
was looking for a practical thesis topic. As I was talking with some
people on the rec.ham.research (?) group about various topics including
packet radio the first codeless licenses were issued and I was *very*
turned off by the arrogance I saw. A few people defended them, but
many more comments were blanket condemnations.

The first article in this thread simply reinforced it, when someone
jumped on the codeless license test for not "randomizing answers."
(I agree the *questions* should be randomized, but I got the sense
that it the real issue was the test itself -- read: codeless tests.")

I've since adjusted how I interpret comments on the net. A couple
years of David Sternlight on sci.crypt does wonders. :-) Plus I've
gotten some very informative comments by e-mail, and am still trying
to consider all of the ramifications of this.

>Your comment above is quite ironic, given that packet radio networks were made
>a practical reality on the ham bands. At least now I know why amateurs put
>their own communications satellites in orbit - to make free long distance
>phone calls.

Packet radio networks are a good example of how the Ham Service should
function (in research, at least. I know there are other components.)
But that also illustrates the frustration I was feeling -- I was interested
and willing to help investigate things like compression with recovery
(since at the time there was no compression; there might be now), but
got hit with so-called experts who didn't care what I knew about Huffman
encoding or LZW compression since I couldn't do Morse (although I was
willing to learn), and a particularly lame media publication that said
packet stations with "blue phosphors" were the high end -- amber or green
weren't nearly as "good".

(I'm not making this up. Hopefully that reporter has since gone on to
a productive career as a fashion reporter.)

: Bear Giles
: bear@cs.colorado.edu/fsl.noaa.gov

I don't care if you know Morse code or not, but what do any of these proposed exercises have to do with RADIO? I think that's where a lot of what you guys observe as "attitude" is coming from. There're people who get their licenses just so they can yak with people. They don't care how the science works, they just want to blab. No sweat. There's a radio service already in existence for those people. There are people who get licenses so they can use amateur radio like a telephone circuit to stay in touch with their SO. Ok. But they [I'm telling you I've heard em] don't even want to know "how it works". Hey, there's a big hunk of spectrum set aside for people who want to do that. I feel THAT is where the rub comes from. BTW, the compression exercise does have its application, now that I think of it, but so far not for AMATEUR radio, yet, anyhow. Cheers.

>Just would like an opinion from all scanner buffs. What is your dream scanner?
>

Hows about something with the specs of the AR8000 built to the form factor of a PCMCIA card. OS2 software for real time multi tasking and multithreading. (Windows 95 too, assuming it ever ships.)

Since I got my AR8000, I've been thinking about a feature I really wish it had, a temporary lockout button. There are a lot of services around here that I like to keep an ear on, but often become a drag to listen to. Ambulances going to the hospital only rarely carry critical patients. Most of the time they drone on and on with the vital signs of people who have bumped their heads or are "shook up" after an incident. The all points bulletin and intersystem channel once in a grand whilehas a hot chase on it that is near my neighborhood. Most of the time long annoucements have no interest to me and are not about anyting in my neck of the woods. It sure would be nice to push one button and have the reciever skip that channel for 15 seconds. If I pushed the button twice, it would lock the channel out for 30 seconds, etc. Some folks listen to their scanners with both hands on the machine and get real quick at pushing a bunch of buttons but I listen in my car and work vechile, locking out a channel is a one button deal but unlocking it a minute later is a pain in the ass. A lockout button with a countdown timer would be a godsend on the AR8000 and a lot of other scanners.

Hi David,

> 2) USER: while holding down 2ndF hit STEP
> DISPLAY: the word "TONE" will appear between the
> "PROG" and "DELAY" markers at the top of

An undocumented feature if you like. This will cause the radio to "HOLD"
when scanning.

When searching you can have "DELAY" or "HOLD" turned on but when
scanning you can only have "DELAY". If you want to scan but force the
radio to hold on the first channel activity press 2nd+step. It will not
resumme scanning until you force it to do so.

It only works with delay turned on so the display has to show both
"tone" and "delay" on the screen.

> the display.It doesn't seem to have anything
> to do w/ the keypad beep.

Nope it doesn't but if you want the beep turned off press 2nd.F + BANK.

You can also force it to start up in scan or manual mode when turned on.

For Scanning on power on press SCAN+ENT+ENT
For Manual on power up press MANUAL+ENT+ENT

> I don't know what any of this means, if anything. But possibly,
> they could lead to a software hack to reclaim the cellular

Sorry but no.

We have had to reset the CPU on several occasions as receivers have
locked up completely - nothing new on Nissei produced sets <sigh>.
You will find the reset proceedure on our URL - details
below.

If something big is gonna happen, there's not a whole lot I can do about it.
But the disturbing thing about the messages I've read in this thread
is that some of the authors have some DESIRE for this to happen.
As in, it'll be so cool the hear how many AMERICAN corpses the EMS guys
pull from the burned out shell of some sporting arena, if that were a
target. How about a U.S. retaliatory strike on whomever we thought
responsible for the "arena blast"? Lotsa neat comms of soldiers going
into battle and dying while these guys sit on their asses listening to
it on the scanner.
Disasters ARE exciting in a strange way, but this thread looks like
a damned tailgate party.

It's illegal in NY, too. "...any motor vehicle equipped with a device capable of receiving radio frequencies allocated for police use" is the wording, I believe. Even if you don't have the scanner programmed for police, and even if it's a handheld in the car. The original purpose, I'm told, was to thwart burglars, etc. from monitoring and eluding police, etc....

May be not much of a tailgate party if the fanatics
unleash some of the new biological stuff Sadamm has stockpiled
according to UN report out this week.

Any Muslim willing to die for Allah in a car bombing can
be convinced that it would be even more desirable
to take out Satan's agents by carrying deadly
plague into any big USA city.

Imagine real cases of Eubbola or Martha or Black Plague breaking
out Feb. 26, 1995 all over the USA. Then all you have to do is monitor the
Med. frequencies to follow the effectiveness of the attack.

BTW I noted report said Sadamm is big on Anthrax, isn't that an animal
disease? How does that affect humans?

We're looking to expand the selection of booklets in our catalog. If you have something to say... something people want to hear... and would like it published in booklet form (40-80 pages, saddle stiched), and the topic is in the area of privacy, surveillance, computer security, technology, hacking or government....

Some of our current titles include:

Hacking: Frequently Asked Questions
The Scroungers Guide to Satellite TV
How to Spy on Anyone without Getting Caught
Directory of Electronic Surveillance Equipment Suppliers
Your SSN from Pension Provider to Privacy Penetrator
Privacy & GEMS
Remote Mind Control Technology
The Satellite Specialists Guide: Inside Secrets

Email me an outline. There is absolutely no cost to you, and you'd be paid a percentage of each sale. We'd prefer that your original be in plain ascii (emailable 60-110K). More details on this offer are also available on our web page:
http://ripco.com:8080/~glr/glt.html

: >> I feel a .uk would be advantagious to us in the UK.

: >What about uk.radio.scanner ?

: I would say, with only half a smiley, that the subgroup
: rec.cellular.mods.legal.discussion.us
: would leave rec.radio.scanner more interesting for the rest of us.....

Lets face it, there is not enough activity on this message base to
warrant a division. Best thing is to periodically (weekly perhaps)
publish the location of the scanner motification files FTP sites for
those needing info. Or a FAQ for scanner models/production codes and IF
they can be modified. When we get to 100+ messages a day then maybe we
should split...

I thought I downloaded a working copy of a DTMF program, but when I
try to run the program I get the "8087 not present" message. What gives?
I thought it might be because I didn't have a microphone hooked up to my
sound card. So I went out a bought one from RS, guess what! Same message.

2350. CRYSTALS FOR BEARCAT SCANNERS

This weekend I found an old Bearcat scanner at a hamfest. Now I just need to find someone who still makes the crystals. Does anyone have an phone numbers or ideas? Thanks in advance for your help

2351. DTMF? EXPLAIN PLEASE.

Newsgroup: rec.radio.scanner
Date: 1995-02-19 01:54:23 UTC
From: jaylgold@crl.com
Message-ID: <3i68cf$1d5@crl12.crl.com>
Source record: 261218

I am familiar somewhat with DTMF but I want to know if it will cut out some interference with other transmissions. ie. If I am listening to the San Francisco P.D. on 880.100 mhz and the radio is scanning, a taxi cab company will come blasting in on the channel. With DTMF set to SFPD will this prevent the Taxi from breaking the squelch on my scanner. If the SFPD is talking on the channel, it totally wipes out the taxi idiot so I can't hear him (good thing).

How does DTMF benefit. I am thinking about installing a DTMF decoder in my unit (optional equip) and before spending the 50 bucks I wanted to know if it is a worth while purchase.

Thanks,

JAY

>Tony Kobylski

Tony, maybe I just got lucky but I ordered a mobile scanner from them maybe a year ago, and it came pronto. But the connecting cord did not fit the jack in the back of the radio. I telephoned them, explained the problem, and they sent me 4 or 5 other connecting cords right away. One (and only one) of them fit fine. Weird. ---Dan, N9XDK

From: maverick@csulb.edu
Message-ID: <3i6dm8$7es@garuda.csulb.edu>
Source record: 261082

Hello,

I was just wondering if anyone knew if there is a mod for the RS Pro 62
to recieve military air band (approx 200-400 MHz)?

I'm sorry if I'm not supposed to post mod questions here, please let me
know. Thanks for the help. Feel free to email me directly if you'd like.

2354. Pro 62 vs. Pro 43?

From: maverick@csulb.edu
Message-ID: <3i6e0g$7es@garuda.csulb.edu>
Source record: 261089

I just bought a RS Pro 62 and I was wondering what the differences between it and the RS Pro 43 are, besides the Pro 62 lacking military air band (approx 200-400 MHz)?

They look almost identical to me, the buttons as well as the functions. Are the internal electronics the same? Thanks for the advice. Feel free to email directly if you'd like.

GOODYEAR BLIMP FREQUENCIES --------------------------

By John (Topol) Johnson KWV8BP
Source: Monitoring Times

Here are a few frequencies you might want to monitor if you ever see one of the Goodyear Blimps fly overhead. A couple quick notes first, there are three Blimps in operation in North America a fourth is operated in Europe. The American blimps are stationed at three locations, one on each coast and one in-between. The Enterprise, tail number N1A, is based in Pompano Beach, Florida: the America, tail number N3A, is based near Houston, Texas and the Columbia, tail number N4A, is based in Los Angeles.
Each blimp is accompanied by a three vehicle ground fleet consisting of a van, a tractor-trailer, and a Greyhound-like bus.

The communications between the blimp and ground crew are normally held on 151.625 Mhz. The blimp also uses VHF aircraft band, communications can be monitored here at 132.00 Mhz. AM. Below is a list of other frequencies used by the blimp.

123.050 Common Blimp port frequency

123.250 Suffield (Ohio) Wingfoot Lake Facility

132.000 Goodyear Tire & Rubber Company channel

151.625 Blimp Operations NBFM

465.9125 Blimp Operations NBFM - Low Power

465.9375 Blimp Operations NBFM - Low Power

465.9625 Blimp Operations NBFM - Low Power

Source record: 261075

In The Bill, sometimes there are situations when Tosh and Carver are in different cars about to raid a place, and they communicate using walkie-talkies with stubby aerials.

What sort of frequencies would these be in real life, and would it be possible to receive them if you were not in the immediate vicinity?

Still on police, sometimes the base and cars are heard on the same frequency, but I thought the bases were almost always split. I don't think this is talkthrough, since I have heard that and it is somewhat different. With this, the base keys up, and sometimes goes quiet but remains keyed up, and then the mobile comes in and talks over the top - there is no heterodyning though, this being FM, but one might expect the base to show the capture effect and block out the mobile......

No cell mod for that scanner. It's the base version of the Pro62; that is,
it is a very good scanner but you ain't going to restore cellular or mil air
or magically increase its channels to 2000.

2361. Do US scanners work in Australia?

Quoting ryr28fan from a message in rec.radio.scanner
ry>Im in the military and live in a dorm on base. I want to use an
ry>antenna other than the rubber duck that i got with my 200xlt but i
ry>cant do anything permanent ar put anything outside my dorm room (ie
ry>window ledge, roof, etc) any suggestions would be welcome

This is a VERY LOW TECH answer (my experiences have shown me that,
with antennae, trial-&-error is worth MUCH more than formula-design)...

I replaced my original rubber-ducky with a 3-foot telescoping metal
antenna (being discontinued by Radio Shack) which closes to 4". The
reception difference is incredible! In fact, the ducky is almost like
no antenna at all.

Then I mounted a permanent 8-band vertical on the roof of my house.
Reception was improved, but not as much as anticipated. So, I climbed
onto the roof with the scanner in hand, and with both portable
antennae also.

I found that the roof antenna was better only because it was higher.
My 3-foot telescoping antenna was just as effective, while I was up
on the roof with it.

So, my personal ANTENNA-TRUTHS-OF-LIFE book says: most importantly,
put it as high-up as possible (roof? ceiling? closet ceiling?) and
keep the wire between the antenna and the radio as short as possible;
secondly, give yourself the cheapest method of trying as many
variations as possible (maybe an antenna-connector fitted to alligator
clips?). Then, spend an evening experimenting. a 10-foot piece of
wire may give you better reception than an expensive commercial unit.

For transmitting, a specially-designed, perfectly-tuned, antenna is
imperative! But for receiving, it just ain't so! This is MY humble
experience.

Jim I realized that I better hit the pass key when I programmed the 30 k step
in that region and DARN IT
The radio didn't skip those frequencies but it stopped on every cell phone
conversation exactly! Apparently the PASS key when it is hit
while proggraming a step OFFSETS the frequnecy so it follows
the images exactly instead of skipping them.

Guess I better read the manual to find out why? <G>

[snip]
: licenses so they can use amateur radio like a telephone circuit to stay
: in touch with their SO. Ok. But they [I'm telling you I've heard em]
: don't even want to know "how it works". Hey, there's a big hunk of
: spectrum set aside for people who want to do that. I feel THAT is where
: the rub comes from. BTW, the compression exercise does have its
: application, now that I think of it, but so far not for AMATEUR radio,
: yet, anyhow. Cheers.

These compression systems do and will apply to amateur radio. The band width through the sattelite transponders is not unlimited. The 2300 Mhz band is finite. Not everyone will want to use the 2meter band to send 1200 bd low speed data across the continents. Real amateurs will want to get their T1 connections across town and will need the new digital radio techniques to accomplish their goals. When the 2meter band fills up, the new amateurs will use digital techniques to put 3 repeaters in the space of the old fm repeater. Yes the cellular folks have already figured this out with the TDMA system. This is not really a private system, just a way of getting three times the use.

Don't let the code-war flamers get to you, they are a dieing breed. You rarely run in to them on the air as they are too busy defending their old technology here on this net ;-) When was the last time you saw a real hacker post some inteligence to alt.2600 or any of its varients...

Do get the new amateur licence, you don't need the old Morse code, but knowing the new digital codes will enhance your position with those who know.....We need you to help design the CDMA systems for 2300 MHz.

Bob

: Thanks for any insight anybody out there might be able to provide.

: - Dave

Down here in Atlanta, these frequencies are used as normal
hospital-ambulance traffic. Each hospital is assigned a certain
frequency, and the ambulance turns to whatever channel the hospital is on.
All of them are on repeaters.

: As far as the ACCESS DB is concerned, why could we not use the basic DB
: capabilities of EXCEL? It does have basic DB capabilities, it (allegedly)
: uses the same VB as ACCESS, and better yet it is available for both MAC &PC?

My computer for radio is a 8088. I can't exactly run windows. Excel/Access
type data would do me no good. Dbase III or Foxpro data would be better.
Comma delimited info is best.

2372. Re: Pro-43 Diode- TRASHED

Newsgroup: rec.radio.scanner
Date: 1995-02-20 11:35:00 UTC
From: ray_reese@tscnet.eskimo.com
Message-ID: <5d.2264.1921@tscnet.eskimo.com>
Source record: 261094

When I purchased my PRO-43 and did the mod for adding 54 - 88 Mhz, using the removed cell. diode, I wanted to be able to listen to the sound carrier for the tv channels 2 - 6 as well as the 72 - 76 Mhz band. It is worth the trouble to make the mode and it does work well in my area, despite not having the correct coils for that band area. Do the mod anyway, but since you don't have the original diode, use a 1N4148 fast-switching diode. Perhaps a 1N914 might do the job also. They can be found at Radio Shack for a cheap price.

2373. PRO-2027 Mods.

Subj: PRO-2027

Want unrestricted 800MHz operation for the PRO-2027? Move diode D35 to the D34 slot. D34 is open on USA/Canada models. Be careful soldering here, the diode is a bit small.

2374. Ontario area TV stations

I wish this were true. The Data Skip facility on the Uniden/Bearcat
BC3000XLT, BC9000XLT, and BC220XLT units I've tried isn't good enough
to recognize the data channel of a Motorola trunked channel and
skip over it quickly.

A friend was reporgramming my Motorola P200 (As an authorized tech of course)
As we were moving frequencies around we can accross a DLP ???. When I got
home to check and see if the other radio worked it didn't. Then I looked
at the freq. printout from the computer and it said the DPL was set
to none.

My question: Is there a way to find the missing DPL without getting a
cord for the P100 (Still Working on DLP). And what does ??? mean in
the DPL world?

Thanks

Source record: 261106

Is it possible for the authorities to identify scanner users by detector vans such as those used to find TV licence dodgers? Could the frequency being monitored also be determined?

After all, both devices are not explicitly transmitters, but emit some IFs.

I refer here mainly to handhelds, since you give the game away anyway if you have a large spikey aerial :-)

Even if it was suspected that you were monitoring "unauthorised" frequencies, and the official was outside your house, could they determine anything without physically seizing it and checking the frequencies?

Or is it quite safe unless you act on spoof UFO landing broadcasts? :-)

NORTH YORK FIRE DEPT.

866.2625 Ch 1 for dispatching of calls and trucks returning to stations
866.7625 Ch 2 alarm testing, pre plan etc.. no interesting calls here.
867.2625 Ch 3 operations
867.7625 Ch 4 operations
867.9875 Ch 5 operations also has link to O.F.M.

As a fire call is dispatched the trucks will switch to channel 3,4 or 5 as
per dispatch on channel 1

After the call trucks will switch back to ch 1

North York fire does have 'talk around' or 'simplex' on all 5 channels so it
is possible at times of bad radio coverage to find them at a scene not using
the repeater. This I only when in undergrounds etc..

>Any source for these old timers?
>I want to upgrade an old 10 channel R/S and a Regency scanner
>Address/phone numbers appreciated

I ordered crystals through the local Radio Shack last year
and had them in about one week.

From the "Buying a Used Scanner Radio" FAQ:

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor
receiver, you will probably want to buy more crystals to
cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack
store or from one of the companies below. Be sure to
specify the operating frequency you want and the brand and
model of scanner.

Some companies may ask you to send a schematic of the
scanner or require more detailed information, like series
or parallel resonance, load capacitance, etc.

It is NOT illegal in Canada according to the Criminal Code of Canada.
Without quoting the complete section, I'll just mention that Section
184.5(1) refers only to persons who intercepts,---- maliously, or for gain

The Radio Act says something different but for criminal law, I believe
that my comment stands. Canada does not follow the U.S. lead in this
regard.

Hi There...

Yup, it is completely legal to listen to whatever you want in Canada.
What is against the law is to communicate anything heard, whatever the
reason. A few years ago it caused a big kerfuffle (is that a word?...)
when a person passed on a taped cell-phone conversation to a reporter. It
started a big discussion on freedom of the press vs the Radio Act. What
did come out clear was that a private individual did not, repeat not,
enjoy the freedom of the press protection.

Well Robert, you have a pretty fancy set-up. First, check that the R 9000 is working well with a simple antenna hooked to the R 9000 jack; presumably, that's not the problem. Next try a direct hook-up of a handheld scanner (such as the AR 80000 via inexpensive cable) to the antenna (even unmounted--try weather channels e.g.). If that works then the Belden cable or jacks may be a problem, else its the antenna or antenna jacks.

Best of luck with your enviable set-up.

Richard

2395. Pro-43 (3A3) or Pro-51 (12A3)--Which one should I get?

Newsgroup: rec.radio.scanner
Date: 1995-02-21 05:29:26 UTC
From: terrymc@southwind.net
Message-ID: <terrymc-2102950029260001@192.0.2.1>
Source record: 261120

I found 2 different Radio Shack's that has these scanners. One has the Pro-43 that is modifiable with a mfg data of 3A3. The other store has a Pro-51 with a mfg date of 12A3. What is the difference between these and which one should I get. The Pro-43 is $249. The Pro-51 is $229. I understand that the Pro-51 has a keyboard mod that has to be done each time the unit is turned on. Also, do either of the mods allow saving the frequencies for cellular into memory?

Thanks

Bob, is there a way to know ahead of time how many miles the map will cover?
The center of the map will vary depending on how much distance the map covers.

Within the last several weeks, TIA has returned to the FCC with a
vengeance, demanding that swift action be taken in the NPRM. The FCC
has taken no such action, unless it's happened in the last couple of
days. I'll letcha know.

> I suspect that the cordless manufacturers are concentrating on 900 MHz
> and have lost interest in additional 44-49 MHz channels.

One would think so; however, that's not the case. TIA is strenuously
arguing that more VHF spectrum is needed nowww!! The 900 meg products
have not yet hit the price point that they can replace the 46 meg
products.

> Their consumer products allies can't be too happy with the idea of cordless base
> xmitters right in the middle of the standard TV I.F., either.

The main squeaky wheels in this matter are outfits like Uniden and
AT&T, which don't make TVs.

From: ad607@FreeNet.Carleton.CA
Message-ID: <D4D1oE.JGz@freenet.carleton.ca>
Source record: 261028

In a previous posting, George Gebara (bk321@FreeNet.Carleton.CA) writes:

> It _is_ illegal to monitor cell and to sell scanners capable of such in
> Canada. Canada likes to follow the American lead wherever it can.
>
Actually we very seldom follow the American lead at all. It is not illegal
for Canadians to visit Cuba for example. There are dozens of laws that are
quite different in Canada than in the U.S of A. I even called Communications
Canada to check on any changes in the Radio Act regarding scanners. As this
Department is the one that enforces violations of the Radio Act they would
know. The poster previously mentioned the CRTC (Canadian Radio-Television
Telecommunications Commission) as the regulator. This is also untrue. The
CRTC mandate extends only to commercial broadcasters, Cable and Phone services
They do not have the mandate to restrict radio listening, as much as they
would like to.

A great way to keep in shape is carry radio gear up hiking
trails. Last time I was near the summit of Grand Manadnock
in NH I don't think I saw a single overweight person.

The best place to play with the radio gear is usually
below the summit. Most importantly, this allows other hikers
to enjoy the summit. You can use the mountain to shield your
radio, so your radio isn't overwhelmed by signals coming in
from all directions at once.

I have a near mint condition Uniden BC2500XLT scanner for sale.
This is a handheld 400 channel scanner with 100 channel per second scan rate.
Coverage is from 25 MHz to 1300 MHz. The only gap is from 550 MHz to 760 MHz.
This is a continuous band scanner, includes cellular. This unit is in excellent
condition and includes AC adaptor/charger, original leather case and two antennas.
Also includes original box and manual. I am only selling this to obtain more ham
gear. Serious inquiries only. Asking $ 250.00 firm. First come first serve.

From: reda@rucs-admin.rutgers.edu
Message-ID: <3id6jn$6g2@igor.rutgers.edu>
Source record: 261046

I had heard of this before, but had never experienced it personally, until recently.

I was deleting (zero-ing out) unused channels. During the process, my 43 locked.
I powered it on and off repeatedly to no avail, and eventually sought the manual
to get the reset key sequence. Gone were all 200 channels...

Has anyone determined why this happens? How can I prevent it from happening
again?

My $.02 on 43's in general:
Aside from the occasional intermod problem around the 150 MHz range, I've grown
fond of this unit.

The US scanners will work for most things. But, there is a difference for public service bands. If you get a RS Pro-39, and read the mod files for it, they tell how to set it for the Australia/UK public service band. (I'm familiar with Pro-39 due to owning one, with the Service Manual in hand. RS stock numbers: US is 20-303 Australia is 20-9303)

: Just wondering if anybody has tried to use the antenna that is embedded in
: the car windshield. Any decent results, such as using a splitter ----- one
: lead to radio/stereo, the other to the scanner?

: Worth the trouble of crawling under the dash to hook it up or no?
: Maybe if I am going to crawl under the dash, I should buy a seperate
: scanner antenna? Any thoughts?

I have used the regular car antenna for the scanner (an older RS mobile/base type with a motorola input jack), my results were that it was better than the back of the set antenna but not as good as a dedicated scanner antenna. The antenna was a steel rod on the fender type not an imbedded in the glass type. The antenna match is less critical for receiving than transmitting but here are the drawbacks by using the car radio antenna rather than a dedicated scanner antenna. 1.Most modern scanner use a BNC connector rather than a motorola so you will need a splitter & a motorola to BNC adapter (RS is a easy source for both). 2. The in the glass antennas are usually 'L' shaped, not good for vertically polarized signals. 3. SOME car antenna/radio connections are accesable only by major effort and it is sometimes difficult to bring out a separate cable to plug into your scanner 4. MFJ makes a 2M ham radio antenna that is easily cut down to an excellent 150-174 Mhz scanner antenna (5/8 wave 3 db gain) on a magnet mount for about $25 US.

Any body have an AOR8000 for sale, I only really "want" to spend 450 to 500. But, I know that the 8000
goes for a bit more. This is only very preliminary! I just bought a TR2400 from the Ace Comm.
company. It was a defect which broke after about 5 or so hours of use! I was shocked after waiting on
a list for over a month! It cost me $450.00! To me, thats quite a bit of money for such a product that has
such rediculous quality control. I sent the scanner back for repair. If I do find another scanner I will
cancel the TR2400 and buy another one, obviously! Well... I hope someone can help me in some
sense? See ya later!

> I was deleting (zero-ing out) unused channels.
> During the process, my 43 locked.

The PRO-43 requires that at least one channel in each bank be enabled.
In the Manual and Scan modes you cannot lock all 20 channels in a bank. The
Program mode will, unfortunately, accept a lockout of the last channel. If
you attempt to scan that bank, the PRO-43 undergoes cardiac arrest and can
only be revived by a full reset. Oh well, you did want to reorder all the
channel assignments anyway, didn't you?

They've been around for a while, under the name Communications
Electronics. I'm not sure what this "Weather Bureau" junk is, but would
guess it is merely a subsidiary set up to help push their weather radio &
home meteorological products.

Their products are good, prices are OK, but usually their marketing
is rather silly hype.

From: Ron Katz <ronkatz@interlog.com>
Message-ID: <3if25j$ns3@steel.interlog.com>
Source record: 261056

I am interested in creating a Ontario Scanner WEB page for quick
and accurate frequencies for emergency services mostly.

I would like to update my records for the areas outside
of Toronto, Durham, York and Peel areas.

The problem is I'm not going to call or ride out around Ontario
to confirm them!!

If you have any frequencies for your area I would be interested in
them especially if its for Fire Police and Amb.

There are too many to list here but If you are interested in
what I already have for your area just ask I'll try and
send them to you. a specific area or frequency.

Any new frequencies in your area??

Ron Katz
Toronto Ontario.

2430. New AOR AR-2700 Info

Newsgroup: rec.radio.scanner
Date: 1995-02-22 10:24:20 UTC

Hiya,

This may be of interest:

The AR-2700 is a handheld unit with coverage from 500KHz-1300MHz.

It does not have SSB capabilities and replaces the AR2000 in their range, nor does it have an alpha numeric screen.

Modes are NFM, WFM & AM with increment steps of 5KHz, 6.25KHz, 9KHz, 12.5KHz, 12.5KHz, 25KHz, 30KHz, 50KHz and 100KHz (On WFM you can only have 50 & 100KHz).

500 memory channels in 10 banks of 50 with 10 search banks Scan/Search speeds are approx 30 per second.

The set can be externally controlled with a Computer via the CU-8232 interface although a small adaptor is needed as it uses a far more "sensible" external control connection (4 pin connector ala battery pack AR1500/BC220 etc).

One other unique option is the RU2700 Voice record chip - this will allow upto 20 seconds of digital recording to be recorded and then replayed whenever the time suites you.

Power requirements are standard (or at least what is now standard) 4 x AA or external 9-16 V dc.

Size is similiar to the AR8000 (153x63x40) although it looks very much like a MVT-7100.

The radio is due to be "launched" in March, availability therefater...? Provisonal price in the UK is expected to be around 269.00GBP inc VAT.

Giffy picie on our WWW page with other details.

I'm about to purchase a scanner for auto racing and I want some advice from experienced listeners.

I am leaning toward the Bearcat Sportcat (SC150). The Frequency Fan Club has this scanner for $218 with audio modification and a free extra battery pack if bought in Feb. For headsets they have the Solution I, II, and III for $59, $75, and $85, respectively. I will probably get the Solution I to keep cost down (I need to get 2 ... you know the SO). So, does this sound alright for a race setup? Any other must haves? Will two standard battery packs last a full day of scanning? They also offer a Nite-Scan modification for $25. What is this and is it worth getting?

Now, after obtaining this jem, what stategies do fans use for scanning. Do you always stay tuned to your favorite driver, MRN, what? By the way, I'm planning on using this scanner for the Richmond (NASCAR) races on March 4,5 so I need the info fairly quickly.

Thanks for any help. You can post or email.

Chris

>Bob, is there a way to know ahead of time how many miles the
>map will cover? The center of the map will vary depending
>on how much distance the map covers.

The short answer is no. The long answer follows.

This week, I made changes in the way transmitter sites are
pictured and this allows me more flexibility in honoring range requests.
The picture which I furnish with RadioMap(TM) reports is still
an overlay plot drawn to scale but it no longer shows roads and bodies
of water.

Last autumn, I changed from using a circle shaped coverage area to
the current square shaped area. The term "range" means something
slightly different depending on the shape. Currently, a range of N
miles from the center means a square coverage area of 2*N by 2*N miles.
Note that for the same range, a square coverage area includes
4/pi (about 27%) more square miles than a circle shaped coverage area.

It would be best to specify the range (in miles) you would *prefer* and
I will try to honor the request for the flat rate. The more transmitter
sites there are, the more work I have to do and the more it costs me
to provide the report. That's one of the reasons I have to increase
the price. I have honored some requests for extra long range,
and restricted frequency reports, but they do cost more and
are quoted individually.

The larger the range, the more difficult it is to distinguish
one site from other nearby sites (resolution). Many folks have
requested between 2 and 4 reports, each covering different areas,
to obtain a better resolution.

As a rule of thumb for the square shaped coverage area, I found
a 4 mile range worked best in most locations.
In rural areas, I found an 8 mile range worked best.
In downtown urban areas (e.g. Manhattan, Chicago Loop), a 1 to 2
mile range worked the best.

Using the street map as background, the range was best when it was
a power of two (e.g., 1, 2, 4, 8). Since changing from a street map to
a streetless plot, I no longer have this restriction and I can
do more "fine tuning" of ranges.

I you have further questions, feel free to call me some evening
between 6PM and 10 PM CST at (708)554-3839, but please don't send e-mail.

>like it before sending in a check...

I've posted this information before so forgive me if you've already
seen it.

I tested a loaner from Uniden and liked it enough to buy one for myself
from The Ham Station. Sold my PRO-43 shortly thereafter.

The 400 channel BC3000XLT portable scans and searches very quickly
and has a great Auto Store feature. Also, it covers a wider frequency
range and better audio than the PRO-43. AM, NFM, and WFM modes can
be selected independently of frequency and programmed for each
channel, as can the Attenuator.

I had less intermod with the BC3000XLT than with the PRO-43.

It's a good step up from the PRO-43 and will appeal to people
who want a high grade portable costing less than $400 or so.

Watch for a review in a future issue Monitoring Times magazine.

Message-ID: <579_9502230135@tor250.org>
Source record: 261072

Hi there!

I just read your message regarding a micro FM transmitter. It stuck out as I'm currently shopping the market for an antenna to *receive* FM and in one piece of literature that came from a my Canadian distributor for a U.S. based product, it states that, "the antenna components used in the 7500 are rated such that the antenna could actually be used to transmit approximately 150 watts".

To be more specific, the product is an AudioPrism Indoor FM Antenna. Model 7500. Let's see if this brochure lists specs.....yup!

Electrical:

Antenna Configuration: J-Pole Shunt Fed, 1/2 Wave Length With Ground Plane.
Impedance: 75 ohms
Connector: "F" Type
Gain: 5.1 Dbi
Polarity: Veritcal Omni Directional
VSWR: Less than 1.9 to 1 from 88-108 Mhz

I suppose with their claim of using it as a 150 watt transmitter, you'd have to alter the electrical aspects of this antenna?

It's overall height is 89.5 inches. Tube diameter is 4 inches and net weight is 9.2 lbs.

For further info contact AudioPrism at P.O. Box 1124, Issaquah, WA 98027. (206) 392 0399 for retailer info on where to get this thing in your area.

Cheers,

Vaughan Huska (Tor., Ont., CANADA)

Scanning strategy. That could be a book in itself (in fact there are
several - just not all about Winston Cup)

I have about 4 different modes that I go into during a race.

1) Listen to everybody. I program every car into a couple banks and scan
through them all. This can be entertaining, but you will usually
find yourself wondering "Who was that?"
NOTE: Using the "Priority" function of the scanner, you can combine
this method with #3 below.

2) Follow a pack. Program a pack of cars into a bank and just scan them.
You have to be ready to change the frequencies on the fly depenfing on
who is in the pack. A pack can be as small as 2 cars.

3) Follow one car. At strategic times of the race, you might want to lock
on to one particular car.

4) MRN mode. I set the search mode to scan just MRN's freq. That way,
when I want to hear them I just hit the search button and there they
are. Hit the scan button to go back to the drivers. During
commercials, MRN can be a hoot.

Of course, there are a million other aspects of scanning a race. Pit
crews, NASCAR officials, police, vendors, car phones, etc...
You have to realize you can't do it all, and narrow your focus to what you
are really interested in.

Anyone else want to share scanning strategis? I am a closet radio geek, so
this is a great way to combine two hobbies!

A

From the FAQ:

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

....

PRO2003: Radio Shack's 1986 top of line. 50 channels + 10
FM commercial broadcast band channels. Includes aircraft.
Good frequency coverage and functionality, but at a high
price. Poor human engineering: difficult to read keyboard
makes the PRO2003 hard to operate unless in a well lit
room. Keyboard label coloring improved on newer units.
Rather slow scan rate and high price. Although there are
provisions for 12VDC operation, the cabinet shape and lack
of mounting bracket makes mobile operation impractical.
Scan rate only 8 channels/sec vs. 15/sec in Regency and
Bearcat. Causes RFI: Plastic case permits scanner to
radiate signals into nearby receivers.
....

That's like asking what TV, celphones, pagers, etc., have to do with radio. No, you won't "chat" with someone, but you might have an internet feed into a remote mountain site which can't afford telephone lines in. Or into the Alaskan outback, on the tail of micrometeors.

>They don't care how
>the science works, they just want to blab. No sweat.

Yeah, but the reason the Ham Service was granted radio space was because hams have historically been the "reservior" for a lot of bright technical innovations. The chatters have a role to play also (e.g., emergency communications after major storms, earthquakes, etc.), but the "researchers" have just a valid claim to the spectrum.

>BTW, the compression exercise does have its
>application, now that I think of it, but so far not for AMATEUR radio,
>yet, anyhow. Cheers.

I remember reading about compressed video *years* ago; I drool thinking about what's possible today, with some hefty computing power on either end of the line....

Remember, think *big*. Why can't you have 2-way video, or even video conferencing? How about a variant on hypertext where you access data stored on numerous sites (not just different places in the same document or on the same computer)? Voice communications is important, but only one part of the possible uses for the (amateur) radio spectrum.

Once again, Percon has done it again. In an attempt to simplify the database interchange capbilites from application-application and CD-application, Percon is introducing a new file format, Universal Frequency DataBase Format (UFDBF). The first appplication to use this will be a public domain editor released by Percon. Details about the editor will be posted as they become available. Like future CDs, the editor will be Mac and PeeCee compatible.

For more (file format) information, contact Percon at 716-386-6015.

>CD-ROM in a useable format.

Victor:

I'm sorry, you say it's excellent, but you also say it sucks. I guess you mean that the front-end sucks. Sorry to hear that. I would have expected you to call Percon to voice your concerns or problems before you slam the product.

Percon has offered (for quite some time now) a US version which has a front-end that offers more search, report, and exporting capabilities. The intent of Spectrum was to provide a LOW cost source of frequencies. Additionally, the front-end was intended to be idiot proof, hence easy to use which meant less technical support calls to Percon. If someone needs more capabilites than what is available on Spectrum, then the US version is available for around $80, which is still cheaper than Groves.

-Mike Baranowski

P.S. Hey, thanks VERY much for your continued support of the 8000 via your www page!! Great work Victor!!

2454. Cell mod for TR-2400!!!

Newsgroup: rec.radio.scanner
Date: 1995-02-23 09:20:09 UTC
From: dbaker@tiger.lsu.edu
Message-ID: <3ihk09$t0h@tiger1.ocs.lsu.edu>
Source record: 260975
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I've been working on a cellular band restoration for the Trident
TR-2400 scanner since I received it in the mail 4 months ago.
Nobody seemed to know much about it, as it is a relatively new
scanner, much less how to unlock the cell bands. ACE communications
was quite uncooperative when it came to my questions about the
cell lock or the possibility of buying a service manual. They sounded
like Sgt. Schultz..."I know NOTHINK!!!". I figured it was hopeless when
Bill Cheek told me he only knew of basic mods for the TR-2400, like
getting better audio quality from the speaker. If he didn't know
about a cell mod, I didn't know of anyone else who would...
A few days ago, I checked out the Javiation web page on suggestion from
Jonathan Clough w/ Javiation. There I found a reset sequence for the
TR-2400's CPU. Neither Jonathan nor I knew what difference there is
between the American and European TR-2400s, so taking a chance that
the cell lockout was software in nature, I went through the reset
proceedure. When I powered the TR-2400 back up, lo and behold, the
cell frequencies were now UNLOCKED!

So, for all those TR-2400 owners in America that want those channels,
check out http://www.demon.co.uk/javiation and look for the CPU
reset under LATEST NEWS (I think that's where it is).
And I'd like to offer a public thank you to Jonathan Clough for his
help, without which I wouldn't have accomplished much.
Dave

WHOOPS!!! The reset proceedure needs to be modified slightly as
the one printed will give you the cell bands but takes away
6MHz to 108MHz!!! It seems pretty obvious what needs to be changed,
but I wanted to post this addendum before I open my TR-2400 up again.

No, it doesn't take them away... only if you mess up and enter the
WRONG sequence, which is what I did. Pay attention to the UP DOWN
DOWN UP , UP UP , DOWN DOWN changes. I zoned out (it is 4am) and hit
UP DOWN every time.

So if you key it in correctly, as shown on the Javiation WWW page,
you will not lose 6 - 108 MHz...
Sorry about that, but I didn't feel like waiting until morning
to work this out, and my mind is losing edge.

Mike.... The Scan*Star Commercial version works VERY well with the AR8000. Yes, it can be used to alter ANY byte in the radio's EEPROM. After locating the correct two lines, it'll take you about 5 minutes to have an unblocked version of your AR8000.... It is a SAFE way to obtain cellular, and not risk serious problems trying to clone your AR8000 from another unblocked AR8000 (if you can find one in your area). Cloning works well if nothing goes wrong, but who wants to take that chance with a $600 radio??? To those 9 people who sent their radio in in response to my posting two weeks ago, I hope you were all pleasantly suprised when all you got charged was the $12 for FedEx return shipping for your now-unblocked radio. Happy scanning.....Daryll

>I recommend that you DO NOT BUY THIS SOFTWARE unless they at least allow
>you to make a backup copy.

>Again the company is RCSI Radio Control Systems Inc. (800) 560-7234

They are not alone. I use ScanStar Pro-edition with opto456. The original
install disk needs Serial# and Activation# in order to install the
program. I made a DISKCOPY of it for backup purposes and try to install
from that and it wouldn't work .
However, original disk does allows me to install unlimited amount of
times as long as you don't loose those numbers mentioned above which is
printed on a small piece of paper. So to be on the safe side I have one
installed on my desktop and one on laptop.

: Thanks for any help. You can post or email.

: Chris

I don't know the tech specs for that particular as I have a
Bearcat 200XLT. The 200XLT is an excellent scanner, with 200
channels, vhf and uhf frequencies. Some drivers use 800Mhz and
not all scanners can pick these up.
One battery fully charged should be able to get you through
one race. If you are there for a full race weekend you will need
to recharge the battery overnite. So if you're camping you'll need
a cigarette lighter adapter for charging.

As far as headphones, I use a pair of shooters earmuffs. They can
be bought at any large sporting goods chain and *very* good ones
cost about $30. I then tore apart a pair of cheap walkman type
phones and inserted them inside the earcups. You can now get
"in the bud" type earphones which eliminate the need the tear
apart step. I fastened some of the wire to earmuffs with tape
for convience.
lastly, I got a mono to stereo jack from Radio Shack. Couple of bucks.

Not as fancy as the Solution headphones but you can put together
the whole thing for less than $30 and they are just as if not more
effective at blocking out the noise.

Good Luck.

If you keep tuned to MRN that is all you'll hear because they broadcast non-stop. I program MRN into an unused channel that is easy to remember, then lock it out. That keeps it from stpping on that channel. Then if something happens that you want to hear what Eli and the boys have to say about it, you just hit the "manual" key and enter the channel number and you get MRN. It also is handy to keep up with the race if you don't have 500 mile kidneys :-)

You may want to examine docs from my collection. A page under construction points
to some of the information you need. Careful reading of the design of the cell
sytem shows you that there are only a few frequencies an active cell can hand off to.
If your radio is similar to the AR8000 there are ways to program it so you can
jump to either of the two sets of frequencies the target jumped to.

URL ftp://FTP.CRL.COM/users/ro/vhealey/www/cellular.html

The information presented there isn't (hey this is how you do it!)
but it gives you what you need to know to do what I mentioned if
you put it all together. I don't advocate anyone monitoring the cell
system unless they are in law enforcement and authorized to do so.

Jesus, so THAT's what I'm hearing. I picked up on several frequencies
last night, all in the 897.xxx range. I thought all I was hearing
were some expensive cordless phones. (which is right, in a sense...).

Is the cellular 'image' common only to bearcat scanners...?

DCS4@psuvm.psu.edu (Dave Shaffer) writes:
: How many cellular frequencies are currently in use. I don't know
: much about 800 band, as my current scanner doesn't cover that
: band anyway, but I'm curious. I know there are only a handful (10?)
: cordless frequencies in the most common cordless phones...all in
: the 46.6 - 47 MHz range. I would think there would have to be
: lots more cellualr frequencies than that. All I could find for
: the moment indicates they exist between 824 and 848, then again
: between 869 and 893 MHz. - Dave

There are about 830 pairs of cellular channels. (849 - 824) / 0.03 ~= 833
Of each pair, spaced 45Mhz apart, the lower one is mobile, upper one is
base (i.e., the cell tower). Channels are spaced 30kHz apart.

Mike

2478. ANTENNAS?

Newsgroup: rec.radio.scanner
Date: 1995-02-24 17:04:00 UTC
From: john.avery@uchoice.com
Message-ID: <1ad.11830.1974@uchoice.com>
Source record: 261000

JW>I am thinking about buying an antenna for my scanner.Radio shack has two
>models I'm interested in they are the 20-014 for 29.99 and the 20-013
>discone ant for 59.99. If anyone has experince with either one of these
>models or can tell me the pros and cons I would greatly appreciate a
>reply.

Both of those are omni directional. If you don't want to use a rotor,
the 20-013 (discone) would probabaly be the best bet.
If you want a super antenna with a lot of gain, (but very directional)
that you MUST use a rotor with, how about a television antenna turned so
it has vertical polarity? I use the VU-210XR (15-2157) for $129.99. It
is a fringe TV antenna. It's big (190 inches long). But it is a heck of
an antenna. I can pick up the low power pit to car radios (450 Mhz) at
the Indy 500 track from about 30 miles. Also the 800 Mhz. At the other
end of the price range, RS also has the UV-75XR (15-2151) for $29.99. It
is very directional and also requires a rotor. Either of these will give
more gain than an omnidirectional antenna. The price you pay is that you
have to point the antenna at the transmitting antenna and you will be
blind to weak signals you are not pointed towards.
Everything has its up side and down side.
Hope this helps.

Cross-posted to: rec.autos.sport.nascar,rec.radio.scanner

Chris Sandridge sent zipping through cyberspace:
: I'm about to purchase a scanner for auto racing and I want some advice from
: experienced listeners.

I've never needed more than the one batt; however, I'm using the BC200XLT.
I don't see why Uniden would build a scanner with LESS run time than it's
predicesor. I can't help you with the headphones. I just use a pair of
earphones and my hearing protectors from shooting.

: Now, after obtaining this jem, what stategies do fans use for scanning. Do
: you always stay tuned to your favorite driver, MRN, what? By the way, I'm
: planning on using this scanner for the Richmond (NASCAR) races on March 4,5
: so I need the info fairly quickly.

I set up all my channels before I go with my favorite driver as the primary
channel. Sometimes I'll program the channel number with the freq. of that
car. You have to paly around at the track to do this though, because you need
to find out which channel each team is using that day. i.e. My scanner stops
on channel 17 freq. XXX.XXXX and I know it good ol' DW I'm listening to.

2481. AR8000 vs R1

Newsgroup: rec.radio.scanner
Date: 1995-02-25 02:35:48 UTC
From: OpenOp@ix.netcom.com
Message-ID: <3im524$otg@ixnews1.ix.netcom.com>
Source record: 261003

I like the ICOM R1 better than the AR8000 .. for my needs it is more useful of a radio. I don't need 1000 channels .. I only need maybe 50 - 60 channels to scan. I just purchased the larger battery for the scanner and a quick charger.

For home scanning I prefer the ICOM 7100 with a Rs232 computer interface -- there is no comparison using this radio with any other scanner out there (including 10 AR8000's).

Have fun scanning everybody!

>The main reason is probably "economies of scale". They sell a
>lot more Ham HTs, than scanners, so in order for AOR to make a profit, they
>cut corners.

Well, another reason is that ham HT's require some decent metal to act as a heat sink while transmitting. MY DJ-580 has a solid metal back and it gets pretty warm transmitting on "High" power. I can only imagine the effect on a plain plastic case. The metal gives it nice heft and may provide more durability, but isn't necessary on a receive-only scanner.

> Did anyone catch the cellular/cordless eavesdropping segment on WWOR news last
> night?
Jerry,
I did catch the piece last week. It was done well, but basically told nothing new. Showed how scanners can
catch cordless and celluar frequencies, and drove home the warning that any wireless telephone communication
is definitely not secure. Nicely done, though.
Ron ron@mail.htp.com

2484. Pro-23 (800MHz area frequencies)

Newsgroup: rec.radio.scanner
Date: 1995-02-25 05:20:47 UTC
From: XHCJ28B@prodigy.com
Message-ID: <3imenf$oo2@usenetp1.news.prodigy.com>
Source record: 261006

I bought a Pro-23 and there are some frequencies missing in the 800MHz area. They are from 823.9375 to 851.868.9375 and then again from 868. 9375 to 896.1125.

But my question is, why are these missing.
Is it a cost/production thing?
Or is it where some Cellular frequencies are ?
Are there scanners w/o these areas missing ?

Any help appreciated...

-
MICHAEL ROTHERMEL XHCJ28B@prodigy.com

Hi, I am very new at all of this, and I would like some advice.

I would like to buy a scanner to get cellular and cordless phone frequencies.
my questions are :
- What models do you suggest ?

- Where can I puchase one in Montreal (if you know) ?

- how do I know if the scanner has cell frequencies
blocked out or not ?

Thanks in advance for your help.

WA1OMM (wa1omm@aol.com) wrote:
: The problem I had with the R1, and the reason I dumped it, was the
: horrendous selectivity which made it impossible to monitor local services
: like PD. A signal on 460.1 would halt the scanner on 460.2. In Boston, it
: was even worse in Boston where there are several PD channels in the 460.2
: to 460.5 range.

: It's too bad Icom didn't pay more attention to those "tiny" details.

: 73, Paul WA1OMM

: Compuserve: 70411,626
: Satellite: KO-23 and KO-25
: Packet: WA1OMM@KB4N.NH.NOAM
Out in the woods, away from the city, I don't have that problem
with my R1. The sensitivity could be better on some of the
public service bands, but it often picks up stuff better than
some of the other radios I have. I played briefly with an AR8000
and the R1 (at least in this relatively quiet RF environment)
pulled in more signals.

Given the R1's solid construction, small size and adequate
performance, I wouldn't trade mine, but then I'm not in Boston,
surrounded by tons of activity.

The search speed is kind of frumpy though and It sure would
be nice to have a backlit keyboard.

From: tomswisher@aol.com
Message-ID: <3intr9$839@newsbf02.news.aol.com>
Source record: 261014

Do you need the Plectron tones or the Motorola tones? They are different.
Plectron used a lot of even tone freqs such as 910.0 and 992.0, while
Motorola uses odd freqs such as 349.0 and 1357.6.

I'm not sure that ACE is as big as everyone might think - or as big as they want you to believe. As for writing the owner of the company - been there, done that - no success. It is my understanding that a number of complaints have been filed with the BBB as well as the Indiana Attorney General's Office.

2496. Cellular phone channels and frequencies

Newsgroup: rec.radio.scanner
Date: 1995-02-25 22:11:43 UTC
From: XHCJ28B@prodigy.com
Message-ID: <3io9uv$82i@usenetp1.news.prodigy.com>
Source record: 260865

Would anyone out there care to explain to me how cellular phones work ?

How far is the range of a cell, and how many channels are there in each one?
Would one phone be pre-disposed to use certian channels, or is it random.

Are certian channels inheritly stronger within one area of a cell, vs. another?
Is it possible for one phone to be on two channels at once, or just when it switches cells ?

Thanks

-
Mike

I have a 580XLT scanner and want to update because some local services have gone to a 800MHZ trunking system. I also want military air. Cel would be nice but I am sort of neutral. Generally want base unit but hand held is OK. Want to spend in the $300 to $350 range. Thinking about 890XLT but a bit worried about Intermod problems. Radio Shack PRO43 also looks good. Would appreciate any advice. Either E-mail or here will be fine.

2498. Baltimore Pd/fd Freq Req:

This is a frequency list that I got off an ftp site somewhere, don't remember exactly where now. Well anyway if anyone here could look at it and tell me how accurate it is, I know some of it is because I have used it to find some local police frequencies that I didn't know about before. Anyways any help is appreciated.

All Frequencies are in MegaHertz (MHz)

2503. Pro-39 vs Pro-43: Intermod & mods

Newsgroup: rec.radio.scanner
Date: 1995-02-26 15:05:32 UTC
From: mbeaty@nyx10.cs.du.edu
Message-ID: <3iq5bs$t9@nyx10.cs.du.edu>
Source record: 261024

I'm comparing Radio Shack's Pro-43 to the Pro-39. I like the 43's features -- no doubt. But I'm getting a bunch of intermod while monitoring on VHF on the 43 that I don't get on the 39. Unfortunately for me, I mostly monitor VHF and I live near an antenna farm.

Because of this, I'm listening to the 39 more than the 43. A couple of questions:
1. Can all of the Pro-39's be modified for cellular reception, regardless of date code? Date code is 12A3, no A on the model or FCC ID suffix....
2. The Pro-43 is modifiable. During the modification process, what could have increased the intermod, if anything? A cold solder joint on the ground wire (or would it simply not work)?

Here's what I think, based on my limited previous knowledge: all Pro-39's are modifiable. The mod on the 43 didn't increase the intermod as the 43 is known to be susceptible, especially on VHF. So, if I'm wrong, I'd really like someone to set me straight!

If I'm right, I'll have a 43 for sale.... Thought I'd never chose a 39 over the 43, but I can't afford both and I'm listening to the 39 more at the moment.

advTHANKSance.

Mike

re: BC890XLT
I owned one for a short time. I found the selectivity and sensisitvity
to be far inferior to my PRO-2004. I also discovered that it scans the
220 Mhz Ham band in the wrong step size and it could not be changed.
I looked into the possiblity of adding a computer interface...too much
hassel as the keypad lines were not easily accessible making a
user-installable interface a great difficulty.

On the bright side, I liked the VFO knob and the stylish looks !

I'd recommend buying a used PRO-2004, 2005 or 2006 instead.

Cheers. Hugh Duff VA3TO/VE3OYH Toronto

Ahh, sounds interesting. But what will the data be; voice, packet, or digital
?%^#@*! ?
The antenna should be easy enough to construct, but the gain requirement at
the freq will make it quite long. My guess, at least a 20' boom.
What NASA mission is it scheduled for?

NC> "RF-9913 cable for my roof antenna, they claim "1.4 dB loss at 100 mHz"
Sounds to me like ordinary "9913". If they're charging more than about .55
/ft, its too much. In 100ft or longer, you can probably get it mail order for
.55/ft.
The original "9913" was made by Belden - call 1 (800) BELDEN4 for their
nearest dealer.

Communications Canada (most of us) became part of Industry Canada in
September 1993. Other parts have gone to Heritage Canada, Government
Services Canada, etc. *sigh*

After tomorrow's budget, who knows? :-(

I buy Plectron and Motorola alerting receivers in good condition.

Doesn't matter whether they are capable of decoding tones or not.

Just need them as receivers. Any bands. E-mail me for cash price.

You need the Scanner Master Illinois Communications Guide. Not only every
frequency you'd want to monitor, but all the CTCSS codes, radio codes,
unit numbers, system info, channelization, etc.

Call (800) SCAN-701 for ordering info or a free catalog.

Ask them about their PerCon CDs, too. Has loads of info!

Tell 'em I sent ya!

Source record: 260935

Hello, I am in need of help.

I have a pro-46 scanner that I just bought the otder day, and it has a date code of 5A4 on it.

I got the 800mhz mod from oak ftp site, and I did it correctly as it said, and I have gotten no more frequencies...

Any help or ideas? Any other mods that will work?

I think I did it correctly to the best of my knowledge, I unsoldered the two smt jumpers on the right, and soldered one of them on the solder pad to the left. There was a blue wire on the right hand solder pad.

Any help would be greatly apprecieated!

thanks!

p.s. Please e-mail me or post asap

Dennis - N4NR

Space Shuttle Radio Frequency List
By Rich Weinkauf, Farmington, MI

A Space Shuttle mission requires the coordination of thousands of individuals; both on the planet, and off. This coordination is directed largely by radio communications, both voice and digital; and supplies the communications enthusiast with several opportunities for listening. The following list includes radio voice communication frequencies reported to be in use during a typical Space Shuttle mission. This list has been gleaned from many sources, including personal communications, messages on Prodigy, Amateur Radio Bulletin Boards, Space and Astronomy Bulletin Boards, and the NASA Spacelink BBS. All of it is subject to change without notice, and reception is dependent on your location and the propagation conditions.

I can be reached for additions, deletions, and corrections to this list via:

259.700 air-to-ground or suit-to-orbiter
279.000 suit-to-orbiter or suit-to-suit

Communications and other stuff: S-band (MHz)
2205.000 Air-to-ground
2217.500 Air-to-ground secondary
2287.500 Air-to-ground primary digital downlink
2041.900 Ground-to-air
2201.400 Ground-to-air
1831.800 primary (USAF uplink, phase modulation)
1775.100 secondary
2250.000 wide band FM with main engine analog
telemetry during launch, or TV during orbit
operations.

Note from Ron Parise, WA4SIR, on above S-band frequencies: "The S-band
system is one of the primary orbiter downlink bands. The voice channels
are digital slope delta modulation and are MUX'ed in with the rest
of orbiter telemetry and are very difficult to copy. Much of the
downlink TV is S-band wide band FM and should be easy to copy.
The Ku-band system is used in conjunction with the TDRS satellites, and
is used more heavily during Spacelab flight than others. The data
rate is very high digital (50 Mbits/sec), and will be nearly impossible
for you to demodulate and decommutate in your basement. Nevertheless,
the shuttle transmits on 15.003 GHz. These transmission are directed
toward the TDRS satellite with a high gain antenna, and cannot be copied
from the gound. The UHF frequencies are fun to listen to, but are not
heavily used except during EVA's. You will almost always hear some
activity on them during a mission, just be patient."

Message-ID: <3irmsp$4ci@newsbf02.news.aol.com>
Source record: 260938

Hey-

You guys at ICOM have an opportunity here. You need to take your R-1 receiver, and make a few changes.

A. Replace keypad with backlit one
B. Get rid of internal nicad battery pack, sell only battery case.
C. Increase the number of memories to 1000
D. upgrade the selectivity of the unit
E. Add SSB
F. Add a serial computer interface

Now THAT would be a killer scanner!
Greg, the RotnApple

Believe it or not, I just saw a file on AOL in the Ham Radio Library that does just that.
You feed the audio from a radio to the mike input (attenuated)
and voila! Or so the description says. I didn't catch the name, but the description should be easy to spot.

Steve

If I remember correctly the Pro2006 originally wa a full coverage scanner
25 Mhz - 1300 Mhz, and RS later modified the design to block certain freqs.

If the sub board which holds D502 and D503 is a modification by RS to block
the cell freqs, and cutting D502 restores cellular what would happen if you
cut D503? Would it restore 520 Mhz - 760Mhz?

Great radio. Very little problem with intermod. Great scan/search speed with search lockouts. Great audio. Great battery life. Good construction. The only drawbacks: 1. Some problem with images (but not too bad), 2. The service serach for the Police band includes non-public service trunked frequencies (making it essentially useless), 3. There are only 10 search lockouts.

> I'm looking for a frequency directory that has private >businesses. Guides such as Police Call have only government >agencies. I'd like one that has tow truck companies, taxis, >security companies and so on. Where can I get a directory like that?

RadioMap(TM) transmitter location reports contain frequency listings for business and many other services.
From the rec.radio.scanner FAQ article:

Over 15% of the FCC licenses, including many fast food restaurants, contain transmitter latitude and longitude but specify no transmitter city. To determine the location of those transmitters requires using the latitude and longitude information.

As I have already done for dozens of radio enthusiasts and companies in several states, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, and produce a custom report. To make it easy to locate transmitters, the report includes an 8-1/2" by 11" scaled plot marked with transmitter sites (no streets). I call this innovation RadioMap(TM) service.

It allows you to identify antenna sites (including paging and cellular phone cell sites) and visualize the transmitter locations in your neighborhood, near your office, at an airport, and other places of interest -- from VLF through microwave. Industry uses RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites.

This is completely different from, and independent of the Grove Enterprises CDROM.

Ham radio stations are not listed. The RadioMap report includes frequencies, callsigns, and licensee names. For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density. A 5 mile range (100 sq. mi. area) works well in most suburban areas. In rural areas, ranges of up to 10 or more miles (400 sq. mi. area) are possible, while ranges of 1 to 2 miles produce best results in urban cities, e.g., Manhattan and

downtown Chicago.

I will produce custom RadioMap reports for areas in any of the 50 states. Send $19.95 (check or money order) for each RadioMap report, your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM central time.

Price increases to $25.95 on April 1, 1995.

Note: I cannot respond to electronic mail inquiries about RadioMap. Please call the telephone number above if you have questions.

: I have a Bearcat 120XLT that I purchaced here recently. Here is what
: I think:
: 1. The quality is good, seems light weight but has a good display, good
: backlight. Very fast scanning, reasonable audio output.
: 2. Ease of use. Overall pretty good. You can get by initially without
: reading the manual but it helps to learn some of the items the scanner will
: do when you read the manual.
: 3. If you plan on using it to monitor low band 30 to 50 Mhz then consider
: another antenna besides the rubber duck. Range is somewhat limited, but so
: is most scanners with rubber ducks that I have run across.

: For the price it is a good scanner $139 to $159 and would recommend it for
: anyone that does not need 800 mhz operation.

It sounds like you are trying to convince yourself not to go ahead and get
the 200 channel scanner (200/205...XLT). It's only 50 dollars more. If you are
sure you will never listen to the other stuff then fine, but I've found that
scanning is addictive and if you use 100 channels just for rail it would be
nice to have another 100 for miscellaneous.

As far as quality, you should be fine with a Bearcat.

It is very difficult to determine. If you were to only consider the "hobbiest" I would make a wild guess at about 30%.

Now, if you were considering law enforcement, FBI, etc., then the number would probably jump way up. My guess would be over 70%.

Also, keep in mind that very few hobbiests have the equipment to track cell phone calls, so for the most part, only a short piece of the conversation is heard as the call moves from cell to cell (although some rural areas have very large cells).

Dave, I won't promise this will work, but you can try it. Holding
down 2, 9, L/O and turning unit on gives you a display check. Holding
down 2,9,SCAN and turning unit on programs some test freq. Holding
down 2,9,Manual and turning unit on wipes out ALL freq.
Good Luck,
Randy

I didn't exactly say impossible, in fact I do know how to do it, and what
equipment it would take. The point is the equipment and dedication to do so,
is lacking or financially out of reach for for most monitoring fans.

Additionally, I don't know what manufactures equipment LA is using. EGE, and
Coded systems are very easy to break, especially EGE (GE), since they leave
the encryption and error correction to the user to provide.

Cross-posted to: alt.radio.scanner,rec.radio.scanner

Hi,

My first impressions of our new 890XLT:

I've programmed the local interesting frequency numbers into groupings (I believe that are 10 buttons that can hold 20 frequencies each). If I put it on SCAN, it'll go through my programmed frequencies. I don't like it that the scanner stops at one of the frequencies that's too far away and is "noise". It'll stay on that noise until I go push the SCAN button again. I'd like the scanner to be able to tell the difference between actual voice and general noise. Also, it would be nice if it came with a remote that has SCAN and HOLD on it, so I can stop the SCAN at a particular interesting frequency without having to dash across the livingroom to hit the button in time. Also, I'd like a clock on it, and, instead of just showing the frequency numbers, I'd rather it display what the frequency is called. For example, if it pauses on 347.560, the display says "347.560". Instead, I'd like the display to be able to be programmed to say "Hospital Helicopter", or something like that.

Just my 2 cents worth.

-Kim

P.S.
What's the difference between alt.radio.scanner & rec.radio scanner??

Good luck Rick. If "Scanning Wisconsin" is still around, I'd be surprised. Mr. Bitter publishes this rag now and then when he gets around to it and the info is pretty dated along with all the typos.

A much better bet for Wisconsin is the Communications Research Group which is a local chapter of RCMA members in Wisconsin and Northern IL. Write to Scott Miller; c/o Communications Research Group; 122 Greenbriar Drive; Sun Prairie, WI 53590-1706. Scott and Carl Guse have the most extensive database of Wisconsin freqs available.

>C. Increase the number of memories to 1000
>D. upgrade the selectivity of the unit
>E. Add SSB
>F. Add a serial computer interface

The R-1 has been out for a few years now. From day one (well, at least,
day 365 - when the Uniden patent thing was settled and it was finally
released in the US) ICOM has been getting complaints about it.

On CompuServe HAMNET the ICOM online rep pretty much indicated that it was
designed as an exercise in miniaturization ... to prove you could put a
wideband scanner into the SAT case. Their attitue pretty much was: it is
what it is, and we have no intention of changing it.

Except, obviously, to remove a 800 MHz coverage later on.

The AOR AR8000 has this capability. Displays frequency, mode, channel
number (A00 thru j49) and a 7-character alphanumeric tag of your choice.
Uppercase, lowercase, numbers, symbols, some graphics, and, Kanji font!
Very nice. The scanner costs between $600-650 depending on where you go.

I posted this several days ago. Had some inquiries, but no
solid offers, so here it is again. Let me know if you are
interested in this unit. I am upgrading (again!). - Dave

For sale: Uniden/Bearcat BC 100xlt -- $100

100 channel programmable hand held scanner.
100 channels, 11 bands, crystal free, automatic search,
priority channel, selective scan delay, display light,
automatic lockout, track tuning (whatever that means..)
and direct channel access.

Some folks reading this probably know more about these
than I do, so suffice it to say that it covers three
ranges: 29 to 54 MHz, 118 to 174 MHz, and 406 to 512 MHz.

I've had this for a year and it works great. I carry it in
my car most of the time but can also use it at home. Sale
price includes scanner, AC adapter/charger, flexible antenna,
carry case, battery pack, and operating guide.

The problem is that one local community has now gone completely
to an 800-MHz "trunked" system, darn them, so I can't hear them
at all with this receiver. Would like to consider an upgrade
to something that would cover the 800 MHz band.

Drop me a note at DCS4@PSUVM.PSU.EDU if you have a question,
comment, or offer! Thanks... - Dave

Hello Dick, name here is Frank, I recently purchased a Radio Shack Pro 62 scanner. The unit is one of the first to use triple conversion superheterodyne tuning. VERY usefull in eliminating intermediate frequency imaging, and it works! This unit is the best handheld that I have seen and used in a strong RF enviroment. It's scan rate is fast enough, easy to program, and overall built well. Radio Shack's upper end units are built by General Research Electronics. Not like their low end units made by Uniden. GRE builds various kinds of receivers for commerical and military uses. Good quailty construction.

Frank . . . .

If you've got about $600 available, get the AR8000.

2557. Indoor Antenna?

Newsgroup: rec.radio.scanner
Date: 1995-02-28 05:26:05 UTC
From: accroya@ix.netcom.com
Message-ID: <3iuc5d$lsq@ixnews2.ix.netcom.com>
Source record: 260974

I live in a "planned community" that doesn't allow antennas on the houses. I KNOW it's stupid, but they're pretty picky. A non-scanner friend of mine told me about an antenna called the Eliminator that turns your house wiring into a giant antenna. Though I have doubts about it, can someone dissuade me from purchasing this - or tell me about my best options. Most of my listening is in the 30-50 range, and the 450-470 range.

Thanks for any help

JW

Well the Pro-51 does scan faster than the 43 and 62. But the
missed channels deal is a misnomer. The 43 and 62 both have Triple
Conversion. But I would quickly turn around and run and grab the
Pro-43. This item is discontinued and can scan the 200-400 band.
It also the entire 900mhz range.

The test codes still work. But the 7A4's will have on channel 23 888mhz programmed in. This you normally can't get on the Pro-51.
And not only does it need to be 7A4 or earlier but it must not have an orange dot on the box. Many RS's have 7A4's but with orange dot's.

>
>for instance.. the Ambulance will talk to the hospital using the
>breifcase radio transmitting on 458.025 which is being recieved by the
>ambulance and being retransmitted on 468.025 which the hospital hears and

there are only 4 458.xxx frequencies, and they do not necessarily
correspond exactly with the 468.xxx - the low powered portables
transmit to the mobile repeater on: 458.025, 458.075, 458.125,
and 458.175. These are sometimes known as "portable 1", 2, 3, 4.
There is no point in listening because if you can hear
them you should hear 468.whatever.

Message-ID: <1995Feb28.113713.20344@ultb.isc.rit.edu>
Source record: 260886

I too, have a Vertex UHF and programming software. Overall, I have to say it's a great radio, and very easy to program, allowing the user to configure each bank to his/her own needs. The programming software is easy to use, especially since I don't have the directions for it...Just the basic ones, and I figured out how to program it easily. I use it in my vehicle, and find no problems with it at all. Cheaper than a motorola, more channels, and that Alpha Numeric display is great.

One question I have for those who have the software for it...How do I program my signal tone? If anyone has the complete directions for doing this, I will gladly send a Self addressed stamped envelope or my address via Email if I could get a copy..

Thanks in advance...

2570. ni cad batteries

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA. It
tells where you can buy your first scanner, what features
it should have, where to get it repaired if required, how
to get frequency information, and mentions a few scanner
clubs worth joining.

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, armored cars, trains, taxis,
airplanes, and buses are all equipped with radios and you
can listen to them. You can monitor the local sheriff and
fire departments to hear about events "as they happen,"
before the news reporters hear about them. Hostage dramas,
bank robberies, car crashes, chemical spills, tornado
sightings are all fair game. In a single afternoon, you
can hear a high speed police chase, Drug Enforcement agents
on a sting operation, and undercover FBI agents as they
stakeout a suspect.

How about listening to a presidential candidate discuss
strategy with his advisor from a 415 MHz radiophone in Air
Force 1, or a team of G-men protect him while transmitting
in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you
can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road
crews, snow plows, and traffic helicopter pilots.

Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

You can even listen to the order taker's wireless microphone at the local McDonald's restaurant on 154.6 and 35.02 MHz!

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. A new law outlaws listening to cordless phones, too, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the laws.

It is now illegal for companies to sell recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a 39 page paperback, ANARC Guide to U. S. Monitoring Laws, compiled by Frank Terranella, available for $9.95 + shipping from Grove Enterprises, PO Box 98, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners bear the Realistic label but are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 40 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often poor.

Deluxe scanners can be controlled by a personal computer, although this feature isn't important to many scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are undesireable due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly

reduces image reception.

Currently, the more popular scanners include the Uniden/Bearcat BC760XLT (a/k/a 950XLT) and discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, and Radio Shack PRO-43 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The new Uniden replacement models, the BC9000XLT and BC3000XLT, work very well and are my current favorites.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 has recently been replaced by the 1000 channel PRO-2035. The portable Radio Shack PRO-62 is a good performer. All three models employ up conversion and are made for Radio Shack by GRE (General Research Electronics). Both GRE and Uniden make scanners for Radio Shack.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a spring shaped antenna, covered by rubber. Although it is small and tolerant of physical abuse, the range of a heliflex antenna is very limited. Augmenting it with a 19" telescoping metal antenna can improve portable reception greatly.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to lightning strikes because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because it they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch

cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Wal-Mart, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200. Telephone (orders only): (800)438-8155.

- National Tower Company, PO Box 15417, Shawnee Mission, KS 66215. Telephone (913)888-8864.

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Marymac Distributing (Katy, TX) sells Radio Shack scanners at discount, but charges a 20% restocking fee for returned merchandise. Telephone (800)231-3680 and (713)392-0747.

- Scanner World (Albany, NY). Telephone (518)436-9606.

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Many ham radio dealers, like Amateur Electronics Supply (Milwaukee, WI, (800)558-0411), also sell scanners.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

If you are handy with a soldering iron, you may be interested in modifying your scanner to add features or enhance its performance. Be warned this usually voids your warranty. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

ftp.cs.buffalo.edu
garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and stocks parts for several older models. G & G sometimes buys old scanners, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $25. A new 3rd edition is expected in early 1995. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes

and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's 168 page Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 9th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and Kneitel's sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. It will likely disappoint experienced scanner hobbyists and is better suited for beginners. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. It works well.

Grove enterprises sells FCC license information on CDROM for $100. The fields are similar to PerCon's Spectrum

CDROM, but the transmitter and licensee location are intermixed which makes query results confusing. The first release has problems with mistakes in the data and documentation, and I look forward to a new release to correct these shortcomings.

Over 15% of the FCC licenses, including many fast food restaurants, contain transmitter latitude and longitude but specify no transmitter city. To determine the location of those transmitters requires using the latitude and longitude information.

As I have already done for dozens of radio enthusiasts and companies in several states, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, and produce a custom report. To make it easy to locate | transmitters, the report includes an 8-1/2" by 11" scaled | plot marked with transmitter sites (no streets). I call | this innovation RadioMap(TM) service. |

It allows you to identify antenna sites (including paging and cellular phone cell sites) and visualize the transmitter locations in your neighborhood, near your office, at an airport, and other places of interest -- from VLF through microwave. Industry uses RadioMap reports to | survey the "radio environment" prior to installation of | radios and wireless microphones at customer sites.

This is completely different from, and independent of the Grove Enterprises CDROM. *

Ham radio stations are not listed. The RadioMap report includes frequencies, callsigns, and licensee names. For a | flat fee, you choose the center location, and I choose the | range, depending on transmitter site density. A 5 mile | range (100 sq. mi. area) works well in most suburban areas. | In rural areas, ranges of up to 10 or more miles (400 sq. | mi. area) are possible, while ranges of 1 to 2 miles | produce best results in urban cities, e.g., Manhattan and | downtown Chicago.

I will produce custom RadioMap reports for areas in any of | the 50 states. Send $19.95 (check or money order) for each RadioMap report, your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM central time. |

Price increases to $25.95 on April 1, 1995.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio users to identify their operations with their assigned call letters, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $24.00 per year, which includes the monthly RCMA Journal, which consists of approximately 95 pages. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz.

Inquiries about RCMA membership should be sent to RCMA
General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly
publication, The American Scannergram, is about 60 pages
long. Although concentrating on Ohio and the Northeastern
states, there is frequency information from other states,
and plenty of good product reviews and scanning tips.

Annual dues are $18 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

AOSC questions can also be sent electronically to:

rccons!aosc_hq@telerama.pgh.pa.us or
dave.marshall@f240.n108.z1.fidonet.org.
FidoNet: 1:108/240.0

AOSC also has a MEMBERS & EDITORS Scanner related echo,
AOSCNet, distributed via FTN on 6 BBS systems, and via
Internet Mailing list. For info on the ECHO only, contact:

R.E. Christian, AOSC PA/AOSCNet Founder
PO BOX 12763,
Pittsburgh PA 15241-0763.
FAX: 412-831-5860.

Internet: rccons!aosc_pa@telerama.pgh.pa.us
rccons!aoscnet_hq@telerama.pgh.pa.us
rick.christian@f220.n129.z1.fidonet.org
FidoNet: 1:129/220.0

To receive a file of info on the All Ohio Scanner Club via
Internet send to: rccons!ftpmail@telerama.pgh.pa.us

In body: get aoscinfo.zip

This will send a UUENCODED info packet to you. The file
contains an outline of the material you will find in the
American Scannergram, the AOSCNet, and an application for
membership. (Note: This file will not be sent back to
*.fidonet.org addresses.)

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is
the foremost club for scanner radio hobbyists in the
northern Illinois area. CARMA was formed from the Chicago
chapter of the Radio Communications Monitoring Association
(RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, most at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $15 check, payable to Kim Moran, to:

The Command Post
attn. Kim & Ted Moran
6143 W. Touhy Avenue
Chicago, IL 60646

Some CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (708)852-1292.

Here is a tentative meeting schedule for 1995. All meetings will be held on Saturdays at locations announced in advance.

February 18, 1995 - Westmont Police Dept.
April 15
June 17
August 19
October 14
December 16

Bring a notebook and your appetite.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

I am often asked, "How do you find these frequencies?"
Scanner enthusiasts can obtain frequency information from
several sources, including books, government microfiche
records, or other listeners.

Books

The most convenient source of fire and police frequencies
is the Police Call Radio Guide, published each year in 9
regional volumes by Hollins Radio Data, and sold at Radio
Shack and larger book stores for under $10. Police Call is
basically a computer printout of FCC license information in
the fire, police, local government, and conservation
services in two lists: by licensee name within state, and
by frequency. Later editions have included a few pages of
local airport and nonsensitive federal government
frequencies.

I highly recommend Richard Barnett's 1992 book, Monitor
America, published by Scanner Master Corp., and available
from Grove Enterprises for about $25. This second edition
is crammed full of police, fire, local government, news
media, sports, national park, and commercial broadcast
frequencies for all 50 states. The information was
compiled mainly from members of the world's largest
scanning club, the Radio Communications Monitoring
Association (RCMA). Monitor America contains detailed
communications system profiles and precinct maps for major
metropolitan areas. Police and fire radio codes and unit
identifiers unique to local agencies are listed for several
cities. This differs from Police Call, which gives a more
sterile, but uniform treatment of licensees, listing even

the smallest of towns. A 3rd edition is expected in early 1995.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Beyond Police Call, available from several sources including Radio Shack, covers the business, schools, and other stations not covered by Police Call, its sister publication. One volume covers the entire USA, but no call signs are shown.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The second edition is about 400 pages and is available from Official Scanner Guide. The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $100 instead. The fields are similar to PerCon's Spectrum CDROM (see below), but the transmitter and licensee location are intermixed which makes query results confusing. The first release has problems with mistakes in the data and documentation, and I look forward to a new release to correct these shortcomings.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. It works well.

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

Over 15% of the FCC licenses, including many fast food restaurants, contain transmitter latitude and longitude but specify no transmitter city. To determine the location of those transmitters requires using the latitude and longitude information.

As I have already done for dozens of radio enthusiasts and companies in several states, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, and produce a custom report. To make it easy to locate | transmitters, the report includes an 8-1/2" by 11" scaled | plot marked with transmitter sites (no streets). I call | this innovation RadioMap(TM) service. |

It allows you to identify antenna sites (including paging and cellular phone cell sites) and visualize the transmitter locations in your neighborhood, near your office, at an airport, and other places of interest -- from VLF through microwave. Industry uses RadioMap reports to | survey the "radio environment" prior to installation of | radios and wireless microphones at customer sites.

This is completely different from, and independent of the Grove Enterprises CDROM. *

Ham radio stations are not listed. The RadioMap report includes frequencies, callsigns, and licensee names. For a | flat fee, you choose the center location, and I choose the | range, depending on transmitter site density. A 5 mile | range (100 sq. mi. area) works well in most suburban areas. | In rural areas, ranges of up to 10 or more miles (400 sq. | mi. area) are possible, while ranges of 1 to 2 miles | produce best results in urban cities, e.g., Manhattan and | downtown Chicago.

I will produce custom RadioMap reports for areas in any of | the 50 states. Send $19.95 (check or money order) for each RadioMap report, your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM central time. |

Price increases to $25.95 on April 1, 1995.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA)1. Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'2.

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information

is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are collected annually, which covers a monthly newsletter, the RCMA Scanner Journal, about 95 pages long. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. A recent liberalization of club policy now permits the printing of most federal law enforcement frequencies, e.g., Secret Service, FBI, Customs, and DEA.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542
Silverado, CA 92676
USA

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

The real challenge is deriving new spectrum usage information. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

More about sleuthing will be discussed in Part II of this article.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?
Part 2: Sleuthing

by Bob Parnass, AJ9S

Part I of this series discussed how scanner enthusiasts can obtain frequency information from books, government microfiche records, or other listeners. This installment discusses digging up new frequencies on your own.

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters.

Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a

local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described in Part I of this article, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls.

A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. Free distribution is encouraged.]

Anybody with enough money can buy a brand new scanner, but you can save lots of money if you get a good deal on a used scanner. Hamfests are probably the best place to find used radios, but you must be familiar with the equipment. Hamfests are repleat with older radios you won't see in today's catalogs.

At last count, there were over 70 scanners and monitor receivers of various brands in my collection. I purchase most of my receivers at hamfests or horsetrade with other radio hobbyists. This article describes a few of the FM receivers in my collection, and is not meant to be complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Several people have been pleased with Electronic Repair Center, in Franklin Park, IL, which repairs scanners for a flat fee. Call them at (708)455-5105 to find out their current rates. G & G Communications (telephone 716-768-8151) is another scanner repair company. This family owned company repairs scanners and stocks parts for several older models. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar

Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series. Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Bearcat BC-101, Radio Shack COMP 100, and Tennelec MCP-1, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The SBE Optiscan (and its Sears clone) required poking a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older | scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

Radio Shack scanners contain a reasonable number of features. All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. A few years ago, the Regency and

Bearcat scanner lines were purchased by Uniden, a Japanese company, and production was moved to Asia.

My favorite VHF/UHF receivers are the 300 channel Radio Shack PRO-2004, the newer 400 channel PRO-2005 and PRO-2006, and the ICOM R7000 and R7100. The ICOM models are more "communications receiver" than a conventional scanner.

Other favorites include the Bearcat 300 and 760XLT, Regency M400, and the Regency K500 (predates the M400), all of which include a "service search" feature.

For portable use, I prefer the Radio Shack PRO-43 and Uniden/Bearcat 200XLT.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

ICOM

R-7000: At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the Icom user with a very annoying clickety-clack, clickety-clack!

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be

installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but has better IF filtering and contains front-end circuitry for VHF-low, VHF-high, and UHF bands. No aircraft band coverage. Three crystal filters. Front mount speaker sounds good. No rescan delay.

Bearcat 12 (Electra): One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

BC101 (Electra): First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC220 (Electra): 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC20/20 (Electra): A BC220 but with 40 channels. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store

feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite.

BC350 (Electra): 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

800XLT (Uniden): 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives

10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels.

BC100XLT (Uniden): Excellent 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): Excellent 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The

most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Radio Shack

PRO2004: Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio.

PRO2005: Radio Shack's top of the line scanner for 1989 and scanner of choice. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although there is no mobile mounting bracket available and the keyboard is not backlit. More

sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended.

PRO2006: Radio Shack's 1994 top of the line scanner. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended.

PRO34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners. |

PRO2022: Base/mobile scanner. Like the PRO2021 but | includes the 800 MHz band. Cellular images throughout the | 847.6 - 869 MHz range. Includes power saver circuit, odd | for a base unit, which can clip the first part of a | transmission.

PRO2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO2003 hard to operate unless in a well lit

room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO24: Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar:

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off

frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorla Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. The Plectron 500 series is less desireable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Parts for Plectron receivers are available from:

Jonathon -

RCMA's _Scanner Journal_ is available at all Ham Radio Outlet stores
nationwide as well as a variety of other radio and electronic shops.

Radio Communications Monitoring Association

Established in 1975, we are "The First National and International
Organization of Monitor Radio Listeners" to quote the front cover of the
our monthly, 45+ page news magazine.

Scanner Journal is primarily aimed at monitoring VHF/UHF Public
Safety in all fifty states, Canada, and the rest of the known galaxy.
That is not to say that we are exclusively for Public Safety monitors! We
also have columns for beginners, Marine band enthusiasts, Air buffs,
Railroad monitors, HF non-broadcast, even a column on Space
Communications.

The staff is completely volunteer and the magazine relies solely on data
submitted by members.

Dues are US$24/yr.

To subscribe or to get a sample issue (US$2.00), Write to:

Radio Communications Monitoring Association, Inc.
PO BOX 542
SILVERADO CA 92676
USA

And please mention that you read about the club on the internet!

|can anyone please advise re AA ni-cads:
|--does a fully charged ni cad deliver power as long as a
|conventional battery?

No. The mA-hour capacity of a NiCad "AA" cell is on the order
of 450-900, depending on manufacturer's model. NiCads have a
relatively constant voltage until near full-discharge though...

|--do the "rapid" re-chargers lower the life expectancy of the batteries?

As long as the temperature rise during recharging is within
manufacturer's specs, probably not... get yourself a copy of the
Digi-Key catalog (1-800-344-4539), as they sell Panasonic NiCads
of various types, including "AA"s designed for 1C-rate recharge
(Rapid Charge "R" type) and High Capacity "E" types...

No. However, the ni-cad battery generally does not taper off
gradually like a conventional battery, rather, it holds the
charge constant then tapers off more rapidly near the end.

: --do the "rapid" re-chargers lower the life expectancy of the batteries?

Generally, I don't think so, as long as you don't over charge.
Radio shack sells a nicad charger that will discharge the batteries
so you wind up taking them thru a full charge cycle, supposedly
making the batteries last longer and not be subjected to the
"memory effect"

Yes, they are handy. I've had 2 baby monitor repeaters in 24 hour
operation for a couple of years now, repeating scanner traffic:

CONVERTING THE FISHER-PRICE BABY MONITOR INTO A REPEATER

Copyright 1993, 1994 Bob Parnass, AJ9S

The Fisher-Price baby monitor (model 157) consists of
an AC operated, low power FM transmitter, and a battery
operated receiver. Both transmitter and receiver are
equipped with 2 crystal controlled channels in the 49
MHz range. The unit modified for this article was
equipped with 49.845 and 49.875 MHz channels, desig-
nated 'C' and 'D' respectively.

This modification allows a hobbyist to connect the baby
monitor transmitter to the TAPE jack of a scanner or
shortwave receiver and rebroadcast the transmissions in
the 49 MHz range. One can roam around the house or
yard with the portable baby monitor receiver, a port-
able scanner tuned in the 49 MHz range, or even a 2
meter walkie talkie tuned to the 3rd harmonic, listen-
ing to transmissions intercepted by a base receiver.

No changes are needed in the baby monitor receiver,
although one could disconnect the red light emitting
diode (LED) to prolong battery life. In the
transmitter, we will be disconnecting the microphone
and installing a 1/8" phone jack and DC blocking capa-
citor.

Parts needed for the modification:

- 1/8" miniature phone jack

- A capacitor with rating of 25 volts or higher. Use of the baby monitor with most receivers requires a 0.001 microfarad capacitor, e.g., a Radio Shack PRO-2004, PRO-2005, PRO-2006, Icom R-7000, R71A, or NRD-525 receiver. Older Bearcat scanners, like the Electra Bearcat BC300, BC220, BC20/20, or BC250 scanner will require you use a 0.1 microfarad capacitor instead.

- insulated hookup wire

- solder

- heat shrink tubing or electrical tape

To modify the Fisher-Price transmitter:

1. Make sure the transmitter is disconnected from the AC line.

- 2 -

2. Turn the transmitter upside down and use your fingernail or a small screwdriver to remove the rubber feet, fastened with rubber cement. You should now see 4 Phillips screws holding the top and bottom of the plastic cabinet together. Remove the 4 screws and save them for reassembly.

3. The rubberized antenna and microphone are connected, using crimp on connectors, to pins on the printed circuit board (PCB). Using a needle nose pliers, temporarily disconnect the white wire that connects the antenna to the PCB.

4. Using a needle nose pliers, disconnect the 2 conductors of the shielded cable that connect the microphone to the PCB. Tape the ends of the shielded wire and stuff them back into the cabinet top. The microphone is disconnected to prevent the transmitter from repeating room noises. If you don't disable the microphone, you will be "bugging" your own house!

5. Remove the cabinet top and drill a 1/4" hole in the side of the cabinet top.

6. Mount a 1/8" miniature phone jack in the hole. Don't overtighten the nut or else the plastic case might crack.

Note: although most phone jacks have 3 solder terminals, we will be using only 2 of the 3 terminals.

7. Solder the end of a piece of insulated hookup wire to the sleeve terminal of the jack.

8. Solder the other end to the pin on the PCB where the microphone shield had been connected.

9. The original circuit placed a DC voltage across the microphone. We must add a blocking capacitor to prevent any DC from flowing between the transmitter and the scanner or shortwave receiver. Solder one end of the capacitor to the tip terminal of the jack.

10. Solder the other end of the capacitor to a short length of insulated hookup wire.

11. Slip a length of heat shrink tubing over the capacitor. If you have no tubing, you can use

electrical tape instead. Solder the other end of the wire to the pin on the PCB where the micro-phone center conductor had been connected.

12. Reconnect antenna to the PCB.

13. Using the 4 Phillips screws from an earlier step, reassemble the cabinet top and bottom pieces.

14. Replace the rubber feet. That completes the modification.

Use a shielded patch cord to connect the Fisher-Price transmitter to the TAPE jack of your scanner or shortwave receiver. If your receiver has no TAPE jack, try connecting the transmitter to the earphone jack.

As a last resort, you could use the external speaker jack. If audio from the speaker jack overloads the baby monitor transmitter, producing distortion, use an attenuating patch cable to reduce the audio signal level.

The same modification has been applied to the PlayS-chool baby monitor, which is housed in a different style plastic case.

If your neighbors have scanners, cordless phones, or baby monitors, they can probably listen in to your scanner, too!

--

2595. RS PRO - 43 and RS Quality

Newsgroup: rec.radio.scanner
Date: 1995-03-01 02:06:43 UTC
From: creal@cs.buffalo.edu
Message-ID: <D4qoJ8.64r@acsu.buffalo.edu>
Source record: 260857

Hello All:

I've been following this newsgroup for about 2 months and finally decided to get a scanner.

After all opinions, I opted for a PRO 43. Knowing the 43 is veryp popular coupled with the fact that RS discontinued it last November I set out to find one against all odds.

After callling every RS in the immediate area, I decided to purchase the last PRO-39 available in one store with the proper date code. I had asked several RS's to look out for a PRO-43 but to no avail. So somewhat satisfied with the 39 that I had found, I downloaded the mod files from oak.oakland.edu and proceeded to open the scanner up. Sitting at home, I grabbed a beer, the solder iron and screwdriver set. I opened the back of the scanner and just as I was about to unsolder the antenna connection, RING! I answer the phone. It turns out to be a local RS store, whose diligent clerk had found me a 43 date code 3A3!

Needless to say, I unplugged the solder iron, reassembled the 39 and hopped in the car to drive to the local RS store, obeying the speed limit of course.

One half hour later I was happliy at home, with my new PRO-43 in hand. I retrieved the mods for the 43 from oakland and grabbed another beer (since I didn't even get a sip of the last one). While reading the mods carefully I decided to try out the scanner before operating on it. I set the limits for 46-49 and started scanning. While reading the mods, I heard nothing from the scanner. Hmmmmmmmmmm. Curious no one is talking. Oh well. Unplugged the scanner and began to open the scanner up. Removed the back cover and to my surprise, I found the circuit board desoldered from the antenna. No wonder the scanner would not pick up anything. Guess the RS tech that did the mod to lock the cellular was in too much of a hurry to put it back together Well, after 30 minutes and one beer I reassembled the scanner,
put the batts in and fired it up. Everything worked great. It's a shame to have a scanner that can pick up cellular when it is against the law to listen. DAMN!

Was listening to the 46-49 mhz range and heard a voice scrambled phone. Now where did I put that number for Ramsey Electronics?

Happy scanning all!

I just recently came into possession of a pro-35, and I'm just beginning
to enjoy the 'sport' of scanning.

I was wondering if anybody has any mods or hints, etc. for using
a pro-35.

Any info would be greatly appreciated.

Thanks in advance

2598. Adjusting AT&T Cordless Phone Channels

Newsgroup: rec.radio.scanner
Date: 1995-03-01 03:39:55 UTC
From: cg1@ssnet.com
Message-ID: <3j0qab$m78@marlin.ssnet.com>
Source record: 260871
Cross-posted to: alt.2600,rec.radio.scanner,alt.radio.scanner

I have two AT&T cordless phones: a 3-channel 1-line phone, and a 2-channel 2-line phone (model 5352). The 1-line phone works fine in my area on 2 of its 3 channels, but the 2-line phone works like crap on either of its 2 channels. I would like to change 1 or both of the preset channels to other frequencies for better reception.

Upon looking inside both the base and handset, there isn't an obvious channel selection rheostat or dip-switch. Does anyone know if there is a non-factory modification to change the presets? This is $170 of phone I'm having to keep in storage because it is unusable in my area.

Thanks in advance,
Mark

That was my first scanner when it first came out ,it is okay but for alittle bit more money you can get something a little better from shack.
They have thee newer stuff on sale alot i had noticed.
If i was you i would hold out and get something with more channels and 880 mhz capability.

Thats just my personal opinion.

2604. Cell plan w/extended frequiencies?

Newsgroup: rec.radio.scanner
Date: 1995-03-01 08:58:10 UTC
From: brett_miller@ccm.hf.intel.com
Message-ID: <brett_miller.154.0008F87B@ccm.hf.intel.com>
Source record: 260850

Does anyone know where to find a breakdown of cellular
frequencies by cell, using the 21 cell plan, which includes
the extended cellular frequencies? I have several charts
that show frequencies by cell, but none of them include
frequencies above 890. I know what the frequency range is
but I need to know which frequencies are assigned to each
cell.

For example, here is a listing of a cell, but notice none
of the extended frequeincies are listed. Can anyone fill
in the missing frequencies for this cell?

Cell # 10

Channel 1 (324) Tx 879.720 Rx 834.720
Channel 2 (303) Tx 879.090 Rx 834.090
Channel 3 (282) Tx 878.460 Rx 833.460
Channel 4 (261) Tx 877.830 Rx 832.830
Channel 5 (240) Tx 877.200 Rx 832.200
Channel 6 (219) Tx 876.570 Rx 831.570
Channel 7 (198) Tx 875.940 Rx 830.940
Channel 8 (177) Tx 875.310 Rx 830.310
Channel 9 (156) Tx 874.680 Rx 829.680
Channel 10 (135) Tx 874.050 Rx 829.050
Channel 11(114) Tx 873.420 Rx 828.420
Channel 12(93) Tx 872.790 Rx 827.790
Channel 13(72) Tx 872.160 Rx 827.160
Channel 14(51) Tx 871.530 Rx 826.530
Channel 15(30) Tx 870.900 Rx 825.900
Channel 16(9) Tx 870.270 Rx 825.270

>

I think what "anon" means, is that these things don't transmit asynch ASCII characters that you just run into the serial port of your computer. If you can get the model number of the terminal, you can order a repair manual for it from Motorola. Your small to medium size police departments are probably *not* paying the extra bucks for encryption, so all you need to know is packet format and encoding scheme, which probably include a significant amount of error-correction.

Once you figure out how the data's encoded, you can go one of two ways. The first is to try and decode it using a PC and a synchronous data receiver chip, like a Z80SCC (Z8530). The second way is to go find a used MDT setup and try to configure it to match the system you're trying to monitor. In either case, you are going to have to do a lot of learning about how the (proprietary) protocol between the MDT and the base works. The protocol itself isn't too important, since you're not trying to be part of the network...so all you're interested in is the data packets and the error-correction scheme.

As a first step, tune in to the MDT frequencies and put an oscilloscope on the detector of your receiver. That should give you a look at the raw data stream on the channel. You can figure out the bit rate and try to decode the Manchester (or whatever self-clocking bit coding they use).

Sorry, no pat solutions, I haven't tried it myself, and I really don't think it's a good use of my time and money. But that's how I'd start if I was going to try.

I'm certainly no expert in antenna theory, but remember this. Even the
experts don't always understand why antenna fields work the way they do.
Obviously you have a makeshift directional antenna so re-positioning it will
give you reception from other directions.

Good Luck

>pretty much anything on the whims of people in Washington who claim to
>know better than us what we want...

Congratulations! Now maybe people will start to see the
validity of what I've been hollering about ever since ECPA (IMHO, the
"Electronic Communications Piracy Act") was passed!

In this case, I WILL say *I TOLD YOU SO*. Give them an
inch and they'll take a mile.

Get with your congresscritter and DEMAND that this assault
on the freedom of the spectrum be terminated, and DEMAND that spectrum
users be made responsible for their OWN privacy, and NOT everyone else.

Better yet, if any of y'all out there are member of radio-interest
organizations, it is high time that each group come together with the
others and file a class-action suit declaring that the ECPA is
unconstitutional on some grounds that it denies citizens equal access to
the electromagnetic spectrum, and that it is an unneccessary law.
Section 605 of the Communications Act of 1934 is ALL that was needed,
stating simply that you could *listen* to whatever you wanted, but
could NOT reveal the contents save for public-intended broadcasts,
amateur Radio comms. and those relating to ships and planes in
distress.

Other than to placate the industry geeks who outright LIED about
security and privacy to their customers, this is NO need for any other
law. Period.

Hi David thanks for the reply. I try to stay away from such sources. I like to conferm any new findings and found that most books and list out there are just duplicates of wrong information found in Haruteq (sp) etc.

I think most persons living in any given area most likly have more correct information then old publications. ScanOnt also seems to have MANY errors.

I would rather hear from someone like yourself who could comferm frequencies for regional areas if I cant.

BTW I will shortly repost my list for ontario and have made some additions to include more areas. (just emergency services)

Thanks again...got to go to work and listen to 6 scanners!!!

I have the CE-232 with the 1.3 version of the Software for my pro-2006.
I purchased the Pre assembled version for $240.00.I have had no problems
with the Hardware or software. I have just picked up a Pro-43 and I am
going to get the personality module to program and control the pro-43 as
well. Bill Cheek is a local San Diegan. His BBS is a great source of
FREQ's mods and Tech Support for the CE-232 and scanners in general. He
also writes the World Scanner Report as well as the Scanner Modification
handbooks 1 and 2.

The installation took the better part of two weekends. I took my time and
had no problems following his printed instructions. Lots of pictures and
Diagrams.

Bill Cheek
COMMtronics Engineering
PO Box 262478
San Diego, CA 92196-2478

BBS and Fax
(619) 578-9247 6pm-1am PST
Fidonet Address 1:202/731
RadioNet Address 500:10/12
Genie Address WCHEEKSR.1

He also has an internet address but I dont have that in front of me. He
prefers the BBS for tech support.

The Auto Program File is really easy to use. The APF format is :

Lable ,Channel #, Freq, WFM/NFM/AM,Delay , lockout, Whatever you want the
Lookup to show as the scanner stops on a frq.

I have used some of the scripts supplied with the CE-232 but have not
written any of my own.

You can create a reject file for all of the Birdies in your scanner.
You can change the delay time of the scanner.
You can autolog activity on any of the 10 search banks.
You can automatically lock all zero freqs.
You can automatically lock out any frequancy that has activity to see what channels are left and remove them.
You can have the computer unlock all non zero Locked channels.

The features I like best are the Auto Programming and the Lookup feature. When the scanner stops on a frequency the computer will look in a file you specify for the user of that frequency and display it on the screen. The file format is the same as the APF format above.

3rd party Software is available that will run the scanner as well.

The CE-232 just Extends the Functionality of your Pro-2004,5,6 the Opto shuts off your processor and uses its own for control. When I purchased the CE-232 the Opto was not available. I still think I would purchase the CE-232 If I had to make the choice today. I'm just a satisfied user, I have no ties to Bill or Commtronics.

If you need any more info let me know.

2622. Scanner Guys

Hey, I've read several posts regarding scanner guides, and everyone here seems to LOVE Police Call by Radio Shack....(And their other scanner guide, Beyond Police Call)...

While these guides are good, how can anyone that lives in the Northeast not know of Scanner Master? Published by Richard Barnett, these books are by far the best...Books are available for Massachusetts, NH/Maine NY/Metro New Jersey, Philly..etc...If anyone wants an address for the publisher, let me know and I'll post it or mail it to you. (My Mass guide is in my car right now-but I'll make that effort if need be!!!)

Enjoy..And no, I don't work for the company!

>wire antenna. I've never heard of anyone that used one for a scanner before.
>VHF Lo signals are vertically polarized and most of your phone wiring is
>probably going to be running horizontally.

More importantly than polarization is the fact that the house wiring is too
long a wavelength for VHF/UHF frequencies. It may work much better for
shortwave, however. Get a discone for your scanner and put it in the attic!
If you don't have room for a discone with a vertical (for 30-50) then get a
discone without a vertical and put two 4 to 5 foot sections of copper
plumbing tubing over opposite ends of the horizontal disc's radials.

2627. Squelch Tones in FM

Newsgroup: rec.radio.scanner
Date: 1995-03-01 22:24:01 UTC
From: mlfowler@lfs.loral.com
Message-ID: <19950301.172401.524@lfs.loral.com>
Source record: 260808

I've been told that some FM transmitters apply a squelch tone to the modulator when voice input is absent. This, I was told, is done because without the squelch tone, the receiver's output consists of "howling". Is this true? If so, why the howl ; I would think that with no input the transmitted wave would be a pure sinusoid at the carrier frequency and that the FM demodulator would provide a zero signal to the audio. ???? Thanks

2630. PRO 2021 - the truth please

Newsgroup: rec.radio.scanner
Date: 1995-03-01 23:52:13 UTC
From: dead@netcom.com
Message-ID: <deadD4sCz1.F79@netcom.com>
Source record: 260829

I've had a PRO 2021 since they came out in the mid '80 s. I have also assumed that they were not capable of receiving the 810-960 band.

That was until a few days ago when I saw a mod on an FTP site that mentioned a diode cut and another operation to restore the band.

The mod mentions that clipping diode #44 restores tuning ability. I can confirm that it does. The mod goes on to mention that IC8 must have an additional jumper resistor to activate the RF for that band.

That's where it gets fuzzy. I tried the mods instuctions of "attaching another 10K resistor" from the 810-960 pin of IC8 (#13) to the RF enable of Q10. What's interesting, is that there is already a marking on the PC board for that resistor, including drilled holes!

But the other bands use a 100 ohm (NOT a 10K ohm) resistor to activate RF for their particular band. I haven't tried a 100 ohm yet, but I will as soon as I get a chance.

My point is, this scanner indeed looks like it is (was) capable of receiving 810-960. And I have noticed that some are offered for sale in Ham magazines as "cellular modifiable."

So what's the deal? Any scanner experts out there care to comment?

>can anyone please advise re AA ni-cads:
>--does a fully charged ni cad deliver power as long as a
>conventional battery?

No, but a well matched pack (batteries with very similar discharge curves) will provide near constant voltage levels until the pack discharges. Alkalines tend to gradually drop voltage while discharging. A well maintained nicad pack will hold 500 good charges.

>--do the "rapid" re-chargers lower the life expectancy of the batteries?

That depends on the type of rapid charger and nicad battery. Rapid chargers that charge AA's at a constant linear rate of 1 amp or greater (instead of the overnight 300mah) do stress the battery. If charged too much it could get too hot and vent. A good rapid charger charges at 750mah - 1 amp but it interupts the charging cycle every 30 seconds or so with a 5 second 1-5 amp discharge. This process is called 'flexing'. By flex charging a nicad you can rapid charge it with little or no damage. Flex chargers are used extensively in the radio control hobbies, cars especially. Manufactures advertise in those hobby magazines. Good models are made by tekin, novak and victor.

: >
: >Steve
: >
: The test codes still work. But the 7A4's will have on channel 23 888mhz
: programmed in. This you normally can't get on the Pro-51.
: And not only does it need to be 7A4 or earlier but it must not have an
: orange dot on the box. Many RS's have 7A4's but with orange dot's.

For Pro-51's after date-code 8A4 you will get the following test freqs
not within the Pro-51's normal coverage.

Channel 14 -- 66.45 MHz
Channel 15 -- 76.825
Channel 16 -- 87.425

BUT NOT CELLULAR
Channel 23 is now 857.2125 (it used to be 888.96)
You can pick up cellular images in the lower 900 MHz region.

If your Pro-51 will not take the test mode 1. You must do test mode 1
WHILE the display test is running. My scanner (7A4) came in a box with the
orange dot and this mod worked just fine. :)

2651. AR8000 Cellular image ~1400Mhz

Newsgroup: rec.radio.scanner
Date: 1995-03-02 06:55:03 UTC
From: woody@portal.apana.org.au
Message-ID: <woody.15fi@portal.apana.org.au>
Source record: 260626

Hello People..

Before I type this i have to warn you I am ny no means a `techno-boffin' when it comes to this, but working alongside with another mate we have found that there is (well in Australia anyway) a mirror image of the cellular cell range (870-890Mhz @ 30 KHz) at:

1420.9 - 1440.9 @ 30 KHz (**This is ONLY with the AOR8000 OK!!!!**)
~~~~ ~~~~~~~
This was calculated by working out the internal oscillation of the AOR8000 which showed us that the cellular range needed to have 550.9 MHz ADDED to any of the 870-890 MHz range and you will hear the same thing (with a supposedly reduced signal)..

So something on 870.2400 MHz + 550.9 MHz = 1421.1400 Mhz

You will hear the SAME thing on 870.2400 MHz and 1421.1400 MHz on the AOR8000 (and lucky enough the 2VFO will show you this quite simply)

I only know the basics of this theory and the 4 signals put out from an oscillator and stepping from one stage of a circuit to another, but I know it works here, and i thought you Sepetics Tanks in the USA might like to have this information.

Of course listening to cellular phones is illegal and i do not condone it at all but this is only theoretical information I am passing to you..(and a hell of a lot cheaper/easier then paying some Enterprising person to clone a Euro version for you!) I can try answer questions but my mate Jim knows more about this then me.. :) Have Fun...

Sorry Make that an offest of +30Khz (Press SSET when entering the Step) or you will be slightly off the right freqs when you try set a Search Range. The calculations show a single Freq conversion but to cover the range you must be sure to give it a +Offset not just a normal step.

When listening in on cellular frequencies what would be the reason that I would only be able to hear one side of the conversation. I tried listening to both the lower 824-849MHz range and the higher 860-894MHz range. When listening to certain calls only one side of the conversation comes in but not all the time. Thanks for any help.

The BC9000XLT allows only half the channels to be label by alpha. (250 of
them).

At Radio Shack, they have a frequency book for ten dollars called " Beyond
Police Calls." I don't have my scanner with me, but I have all the Disney
frequencies on it (I'm an annual pass holder). I even have the frequency
for the new Indiana Jones Ride.

And, within the above range, you'll find the repeater
OUTPUTS between 146.600 and 147.390.

I could post the entire 2-meter and 70cm band plan, but
I'm too lazy to type it all in.

Any one have a handy ASCII file of the amateur band plans
from 6 meters and up??

Hello People,

Does anyone have ANY Freqs for the Avalon International Airshow 95 at Avalon
in Victoria on the weekend of the 25th???

I would REALLY appreciate any info that people have on this airshow as its the
1st time im going to make the trip there (gotta see the FA18's and so on
again! (and i Luuurrrv the smell of AvGas! :))

The only things that i know so far are:

Avalon Airport:

Nav Aids:

VOR AV 116.1 (*1)
DME AV 108X
ILS IAV 109.5
L RPY 224 (Ripley)
L AV 260 (*1)

*1 FREQ used for ATIS

Air Traffic:

TWR Avalon Tower 120.1 (P) 314.6 (P UHF) 129.3 (S)
ATIS Avalon 260.0 116.1

*1 TWR/CTR activated by NOTAM

MTAF:

120.1 (AH)

UNICOM:

129.3 Callsign "ASTA Flight OPS" - 2200-0630 (2100-0530 Daylight Savings)
Fuel, ACFT parking, General ground requirements

and the usual:

Roulettes:

Primary: 133.9 Secondary: 338.5

Also used:
264.5 268.8 288.6 375.4
325.8 126.2 335.8 257.1

J.D.

You might find the freq. you want in "Beyond Police Call" at Radio Shack.
If not, I would recommend you try one of Bob Parnass's "RadioMaps" for your
area. See his posting on rec.radio.scanner about Finding Frequencies.
I've got 2 of his RadioMaps and they are excellent for locating transmitter
sites and freqs. within your area. Wish I had what you want, because I
also monitor Mall security near my home. Good Luck.

HAppy MOnitoring ....

824-849 are mobile frequencies and there will only be one side.

The base frequencies sometimes don't transmit the sidetone (an echo of the
mobile caller's voice) or suppress it so much that you don't hear it.

Source record: 260728

I did the mods, and I also noticed the mismatch in resistor values - and put
in the correct one. It don't work; what it seems to do is enable the 450 front
end when 800 is on. Now this may allow you to receive some 800 freqs as
450 harmonics. I tried a bit by manually keying a cellphone; there is
some signal
detected but sesitivity is way down. It may be that you could peak the
front end
and get some more semsitivity out of it.

What's really needed is a front end that receives 800 and a mixer stage
to get it
down to the IF; they may be there but I do not have a schematic to check
it out.
I can;t see why they would have the stuff there but leave it disabled
(although
stranger things have happened).

I thought a neat hack would be to get on of theose external 800
downconverters,
and wire it in to enable it from the band select chip in the 2021.

If you want to discuss this more Email me at detschel@vnet.ibm.com. If
you have
a copy of the schematic I could look at I might be able to figure out more.

Grundig YB-500 - 1

I was looking at the Grundig Yacht Boy 500 recently because of its having RDS - I suspect that the RDS on the Satellit 700 is similar / identical. It has a diagnostic feature where you key something like 1-2-3-4-5 before switch on. It then will read various details of the RDS - like PI, TA, TP and also the RDS "quality".

But it does not use any of these features. It displays the PS - station name - but I am not sure if it uses the AF automatic retuning of RDS. It display the Travel News flags TA & TP in diagnostic but does not use it at all.

There is a clock on the radio but it is not updated from the RDS CT clock. Its a great pity that a bit more thought had not been put into the design. Incidentally this diagnostic function is present on some car radios, usually needs a series of key presses to get into the mode.

I ended up getting the new Sony RDS radio - its not a SW radio just VHF/MW/LW I was quite disappointed with the design of that also and wrote to Sony in Japan - they confirmed my suspicion that it was designed in Japan where they have no RDS !

It does update its clock from CT though. Also uses the TA/TP flags to allow you to get Travel News from another channel.

They do not have fully automatic returning using AF but you push a button to step through the various Alternative Frequencies.

I was most disappointed by its not fully using EON (Enhanced Other Networks), it has it so that it can retune to another station for Travel News. But I was hoping that I would be able to tune one memory to BBC Radio 2 in a new town and the other 4 memories would be loaded with the local frequencies for Radio 1, 3, 4 etc using EON. But it doesn't.

****

Sony 2010 - 3

I found it VERY easy to plug in and start listening. The supplied instructions are adequate for what they do, but
are not really enough to really start enjoying the radio. The whip antenna works great at home, but just doesn't cut it at work (way too much metal/interference). Even the supplied wire antenna does not seem to help at work (I have not yet tried it at home

(no real need).

****
Realistic DX-342 - 1

I've owned this little radio for about a year
now and am really pretty happy with it.

Advantages: Size - Measuring approximately
4 3/4 x 2 5/8 x 1, you can take this little
mini anywhere! Even slip it into your shirt
pocket!
SW bands - Covers 9 SW bands: 49m, 41m, 31m,
25m, 21m, 19m and 16m.
MW, FM, FM Stereo (thru headphones)
Travel Power lock
Push button control
Runs on two AA batteries or AC adapter
Travel pouch
Carrying strap

Disadvantages: It's an analog unit, guys and gals,
no digital display.
No back stand
Antenna does not rotate up

I've had a lot of fun with this little receiver. The
SW sensitivity is quite good for my area of the
country, Cleveland, Ohio. The speaker has a nice sound
and improves thru the earphones. FM stereo thru
headphones is great! MW DXing is surprisingly
good! I can grab signals from Boston, Chicago,
New York and Cincinnati much better than on my
Magnavox AE 3625 Digital!

Summary: A nice little travel radio that's fun
to fiddle with or take for travel when you're in
a pinch. Radio Shack has discontinued this model
so you might be able to find it on sale for around
$50.00. I love the size! Ideal for travel! I'm
beginning to think that anything larger is too
cumbersome. I do miss the Digital Display and all the
features that go with it: Freq. display, Alarms,
world time display, etc. If I were buying today, though,
I'd consider what else is out there for just a bit more
money. For example, the new Sangean 606 is only
slightly larger and has all the digital features mentioned above that I miss. I
've seen it priced for as little as
$179.95!

****
Realistic DX-350 - 1

I bought this radio when I first started out in shortwave listening because it was the cheapest thing at Radio Shack. I think I paid $60 for, but I'm pretty sure the price has gone down since then.

Nowadays I mostly use it as my travel radio. Sesnitivity is okay for the price, but not too great. When I'm at home (western US) I can pick up the major international broadcasters, but no too much else. On my trips back East, I've found sensitivity picks up some, but it's still only fair.

Performance on the AM and FM bands is average, but longwave seems to be nearly useless. I've never heard any nav beacons on this one, even though there are several near my house.

Radio Shack sells a reel antenna for about $8, and I picked one of these up when I bought my radio. It helps reception a little, but not very much. A much better solution is to wrap a stripped end of a wire around the the whip antenna, and attach the other end to a metal windowframe. I've tried connecting my longwire to it, but that just overloads the receiver (not surprising).

One major problem that I've noted is that the dial markings on some shortwave bands seem to be off by up to 10 kHz. If you know about it, it's not much of a problem to work around, but initially it could be quite confusing.

Overall, this receiver is average for its price. There's no real surprises, either good or bad. If you really want an inexpensive radio, go for this one. Otherwise, I would advise saving your money and going for an inexpensive digital radio.

****
Realistic DX-375 - 1

It costs $99.99 though I got it for $89 since I had a coupon for a rebate. For the price I think I got a good deal. It has digital tuning and direct input of frequencies which allows tuning to be a pretty simple job and not a time consuming act of patience. It uses two C type batteries... I use rechargable ones and they last a pretty long time..

It is not small enough to carry in your shirt pocket but it could fit in the front or side pocket of an average sized backpack. It is just great when you are walking back home from school/work ... it can be easily carried in one hand as you catch up on the news from BBC/Deutschewelle/Radio Australia/etc.... as you walk home..
I get decent reception of all the `big stations' even indoors and have, on occasion also been able to tune to Radio UAE....

The sleep function is perfect for someone like me who likes to fall asleep with music... the FM sound is pretty good in stereo (headphones)... The AM reception is also fairly good but it has a very high tendency to catch those Bible bashing stations...probably a reflection of the region where I live...

The strap is a little shoddy and I have a feeling I may have to `fix it'
soon... I expect it to pop out any moment....
Despite that, I like it...

****
Realistic DX-380 -2

I've owned a DX-380 for about 9 months now and....
It's a GREAT RADIO! However, I should qualify
this. I bought it on sale from Radio Shack for the
bargain price of $129.95! It regularly retails for
$179.95. At $130.00, this radio is a real steal!

About the size of a large paperback book, the 380
is feature packed!

*DUAL CLOCKS
*ALARM WITH RADIO/BUZZER
*60 MINUTE SLEEP TIMER
*DUAL BANDWIDTHS
*DIRECT FREQ. ENTRY TUNING
*TUNING KNOB
*SLEW TUNING
*TUNES IN 1 OR 5 KHZ STEPS
*CLOCK DISPLAYED SEPARATELY
*BACKSTAND
*STEREO THRU HEADPHONES
*CONTINUOUS SW COVERAGE...NO GAPS!
*AUTO SCAN UP OR DOWN
*ANTENNA ROTATES AND SWIVELS
*CARRYING CASE

The sensitivity of this radio is GREAT! With a reel antenna, it's even
better! I read another review that said reception was lousy....I think
that individual should check his particular receiver as he might have
the rare defective unit. MW reception is also outstanding and with a
Slect-A-Tenna is greatly improved! Herein Cleveland, I pick up
Chicago, Cincinnati, and Pittsburgh during the day WITHOUT the
select-a-tenna! With the S-A-T reception gets an added boost!
(these are all 50,000 watt stations)

I have found it to be about the perfect travel size. I would like
something smaller, like the 606. This size, however is fine. I've
carried hardbound books on jets that are larger. The many features
makes up for it's slightly larger size over a mini. It does not have
SSB, but I really don't miss it.

All in all, A great radio priced at $130.00! I would not have bought
it for the price of $179.95. There are other radios in that price
range that ive ya more bang for the buck. At $130.00, it's a great
deal! If you can get it at that price, snap it up!

I am by no means an expert, but I have a DX-380 and can give some
of my experiences. First of all, I would pay the extra to get the

390 to get the single side band capability. I miss it. I miss it. Also, the sensitivity for foreign broadcasts (I'm in DC) without an external antenna is poor. You get the BBC and some German broadcast relays from Canada transmitters, some south american stuff, and that's it. BUT with a 50 m Cu wire out my 2nd story window attached to the antenna with an alligator clip, I regularly get Abu Dhabi and Australia at night.

****
Realistic DX-390 - 2

Great mid-sized digital portable. Good sensitivity and selectivity. Digital display shows time, frequency, signal strength, and memory location. Covers LW (in 9 kHz steps), MW (in 9 or 10 kHz steps) and SW continuously from 150 kHz to 30000 kHz. FM reception (88-108 MHz) with stereo through headphone jack. BFO control for SSB reception. Built-in timer/clock, 9 programmable memory locations per band, except 18 on SW. Good audio output. RF Gain and AM bandwidth controls. Keypad frequency entry. External antenna, AC-adapter inputs.

A great radio for the beginner or as an upgrade from a smaller and/or analog unit.

Purchased from Radio Shack for $219 in January, 1992.

I have a new Realistic DX-390 (alias Sangean 813??). Seems to be a great value for the price $169 US. I haven't yet heard from someone who can recommend a radio for the same price that is better, and can back it up with facts.

****
Grundig Satellit 700 - 3

Truly a world-class portable, digital receiver. Excellent sensitivity and selectivity. Digital display with two separate clock/timers, signal strength meter, band selection, frequency readout, and user-definable eight-character "name" for each memorized station. Has RDS circuitry on FM to decode the newly-phased-in system for identifying stations by call letters, format, etc. 512 memory positions, upgradable to 2048. Tunes in .1 kHz increments. Selectable wide/narrow bandwidth for AM mode reception. Tunes MW in 9 or 10 kHz steps. Keypad frequency entry. Receives USB and LSB. Synchonous detector helps pick difficult-to-receive stations out of the crowd. Selectable automatic/manual gain control. Covers LW (150-353 kHz), MW (528-1611 kHz), SW (1612-30000 kHz), and FM (87.5-108 MHz). Excellent audio output, with separate treble and bass controls. Stereo through headphones or external speakers. Line-level out (left and right), external antenna, and 12 VDC-in jacks. Local/DX switch. Built extremely rugged. Multi-national power supply included.

An outstanding performer, and worth the price to a serious SWL or DX'er who requires portability.

Purchased from Universal Radio for $479 in April, 1993.

The Following is a comparison of the SONY ICF-SW77 and the GRUNDIG SATELLIT 700:

Both of the receivers you are looking at are pretty solid. The Sony is slightly smaller and has a somewhat more "finished" feel about it. The Grundig is SOLID with a much better sound. Neither is as good a SW signal receiver as the previous Sony, the '2010 (2001). However, they both have very advanced features; multiple (and in the Grundigs case, expandable) memories with alphanumeric tags so that you have a name as well as a frequency, all sorts of memory grouping and scanning etc. The Grundig has good RDS ident. on it's FM band, but I have a feeling that this isn't used much, if at all, in the US. If you intend to buy second-hand, be very wary of the SW77 - the early version was pretty flakey. The later version is better but still not as good as the '2010.
I think that the choice comes down to "feel". They are both quite complex to use, but both work as advertised. Try 'em both as they have quite distinct operational methods. If sheer performance on SW is the main point for you, compare them with the Sony ICF2010. You'll buy it and save some loot !
For what it's worth, I tried them both and settled on the Grundig. I have my Satellit 700 in daily use and it's performed without a hitch.

My reasons for the choice were:

1. Performance. The Grudig was much better than the early SW77.
2. Sound. I happen to prefer the slightly bassy Grundig sound to the somewhat sharper Sony.
3. Power. The Grundig takes D cells and can self-charge Nicads in the set, which is how I have it set up. (The SW77 used C cells) They both run down batteries fast. The Sony worse than the Grundig due to it's smaller cells.
4. RDS. I love it and the SW77 doesn't have it.
5. Feel. I like the, I don't know, Germanic solidity and sheer heft of the Satellit. A Satellit with a full load of 4AH Nicads can tip the scales at twice the weight of a SW77. Of course, if drop one on your foot the Sony would be the better bet ! I only use the Grudig about the house. I have a '2010 for the road.

I hope this splurge hasn't clouded the issue for you.

Editor's Note:
I have one of these radios and love it! I sent the following message to someone just after I bought it.

I just recently forked out $500 and bought a Grundig Satalit 700. The sound from the radio is truely impressive! I have always wondered why broadcasters put music on shortwave, because it alway sounded like garbage. However with the 700 I can listen and enjoy the music. The 700 has Bass and Treble controls, which improve the sound quality but the Automatic Gain Control most likely does the most toward improving the sound (I'm not an expert, so this is just a guess!). Anyway my Wife regularly listens to music coming from a 60m band radio station in Guatemala, and can enjoy the sound. However there are some bad points. It is programable, but I have not worked out how to do it yet. Well I tried once and gave up. This is not too bad though, because BBC, Deutche Welle, and about 10 others are stored in a ROM table. And these frequences actual work (i.e. they are the frequencies for North America and NOT Germany).
Also I connected a long wire antenna and found my local AM station on shortwave. I guess the front-end is not good enough to sort the signals out when coming from a large antenna. But don't worry about this either.
If you only want to listen to the biggies like BBC, Deutche Welle, you won't need an external antenna. I am planning to put a Pre-selector between The Radio and the Antenna, and I think this will cure the problem of AM stations on shortwave and cut out some interference. Finally I recommend this radio to you. I'm sure you will have hours if enjoyment from it.

****
Grundig Satellit 500 - 2

Formerly Grundig's flagship portable SW receiver, this is still an excellent piece of equipment. Excellent sensitivity and selectivity. Digital display with two separate clocks (only one displayed at a time), signal strength meter, frequency readout, and four-character user-definable "name" for each memorized station. 42 memory positions. Tunes to .1 kHz increments. Selectable wide/narrow bandwidth for AM mode reception. Tunes MW in 9 or 10 kHz steps. Keypad frequency entry. In addition to AM, has three receiving "modes" for LW, MW, and SW: USB, LSB, and "Sync," which should more accurately be described as "fine tuning," as this implementation of synchronous detection operates differently from the Satellit 700 or Sony 2010. Selectable automatic/manual gain control. Covers LW (150-353 kHz), MW (528-1611 kHz), SW (1612-30000 kHz), and FM (87.5-108 MHz).
Excellent audio output, with separate treble and bass controls. Stereo through headphones. Line-level out (mono), external antenna, and 12 VDC-in jacks. Local/DX switch.
Built extremely rugged. Power supply included.

An all-around great performer. Now that it's discontinued, many outlets are selling this unit at close-out prices, making

this radio an excellent value for the money.

Purchased from Universal Radio for $379 in December, 1992.

I have a Grundig Satellit 500 and am basically satisfied with it. I miss the 512 memories of 700 and 'SSB clarify' control sometimes.

Yes, its 'sync' is exactly fine tuning in 100 Hz steps. However, it is rather simple to make it work similarly to '700 and '2010, because the detector chip is the same in all three. Only a switch with two pairs of contacts is needed. Another design fault, the excessive distortion in SSB mode, can be partly cured by adding two resistors. For serious DX-ers it may be important that the internal ferrite rod cannot be disabled on MW and LW in both 500 and 700, so the in-house noise may become a problem on these bands.

****
Lowe HF-150 - 1

The Lowe HF-150 (sold by Universal and EEB) is a nice compromise. Similar number of cubic inches as the Sony (different shape), but offering some features of the R8. Also the Lowe is made with a mostly solid alumnum case, which is better than the Sony or the Drake. The Lowe has dual antenna inputs (wire or SO-239), record out, audio out, 12vDC in. It can run off any 12V DC battery. I use 7 aH gelcells which I recharge. The Lowe also takes 8 internal AA nicads *OR* disposable batteries. It will recharge the nicads with a builtin recharger if you plug it into an external power supply. It's a nice semi-portable radio. It has a few ideosyncracies, but you might want to look at it.

****
Lowe HF-225 - 2

I've had an HF-225 for a few years now, and I'm pretty happy with it. I use it mainly for broadcast listening. It's connected to 25m of random wire via a 5m coax run inside the house.

I tried using an ATU to improve the matching between the aerial and the coax, and on some frequencies it gave a (small) improvement in signal strength, but it was such a pain to keep retuning that I gave up using it.

I recently bought a "magnetic longwire balun", and this seems to offer the best of both worlds - improved matching between the wire and the coax, but no retuning necessary. It's rather expensive, though, and it may be that I'd have been just as well off with a home brew transformer on a ferrite ring...

The other potential advantage of an ATU, filtering out of strong signals well away from where you're listening, seems to be

completely irrelevant on the HF-225. I've never yet found a case where switching in the attenuator did anything beneficial. The receiver's front end seems to be excellent in this respect.

I've got the sychronous detector option, and I wouldn't be without it. It quite often makes a heavily fading signal quite pleasant to listen to. Pity it doesn't have a selectable sideband option, though - I quite often find myself tuning an AM signal in the LSB or USB modes to try to get rid of an adjacent interfering signal.

Would I buy it again? Yes, unless I decided that I really wanted a receiver which offered a computer interface.

****
Sony SW-1 - 2

I bought an SW1E over a year ago, for listening to broadcast SW and FM at home and while travelling. I like this very small radio a lot. It is maybe expensive for a portable, but the build quality is very good, - everything looks and feels right. Battery life is good, and the set DOES work with NiCads (2*AA) contrary to the instructions. Reception of broadcast SW is good, either with the whip or clothes-line antenna. I've never noticed any big problems from adjacent channels either. As a bonus, FM stereo reception is good through headphones. Audio quality from the in-built speaker is fair, but you'll want to use phones for noisy environments. The only bug with this radio is the memory capacity - only 10 mems is really not enough to cover ALL of AM and FM.
Summary - if you want a very small portable, and appreciate high quality (and can afford it), I would recommend the SW1E. Note the E, which denotes the SW1 kit without the active antenna and brief case - these add a lot to the price, and I don't rate the antenna too highly either.

****
Sony SW-15 - 1

I bought one of these puppies on impulse the other day (at my age you should give in to the occasional impulse, just so they keep coming). Cost $85; you could probably do better by shopping the discounters.

Specs:

Dual Conversion Receiver, 6 1/2 x 4 x 1 1/2 inches, 3 AA or 4.5v DC.

Nine Bands:

FM: 76-108 Mhz, 10.7 Mhz IF.

SW: 5.775 -6.425; 6.875-7.525; 9.375-10.025; 11.6.5-12.265; 15.00-15.65
17.50-18.15; 21.325-21.975. 1st IF 10.7 Mhz; 2nd IF 455 Khz.

MW: 530 - 1710 Khz; 455 Khz IF.

Analog Tuning dial, volume control, music/news tone switch, 7 position SW band selector. FM/MW/SW select buttons double as "on" switches. "Off" button. "Hold" button to disable "on" (prevents accidental turnons) Slide rule, multicolumn frequency display. Hand strap, foldout stand to hold at angle on table, soft carrying case. Basic shortwave guide. Telescoping antenna. FM/MW/SW "on" and tuning LEDs. Mono earphone jack.

Subjective Review:

I'm pretty impressed. Sensitivity is up there with the Pomtrex [:-)] without the "splatter" of strong stations. Analog tuning dial requires a delicate touch but for me that's part of the fun. Drift seems nonexistent; you get a station and it keeps it without a lot of vernier twiddling. MW performance was surprisingly good, as was FM. I'd recommend it as a starter radio.

****
Sony ICF-5100 - 1

I bought this radio in Kuala Lumpur in 1988, and I'm not sure if it goes by the same model number in other parts of the world. It is a shirt pocket analog tuned radio with coverage from 6MZ to about 21MZ in seven bands. The radio is very rugged and has served me well despite of the physical abuse it has gone through. Because of its small size the speaker is only small and the sound from it it a little tinny, but I used it mainly to receive news in countries without English language news services and in remote areas while camping etc. I recommend this radio to anyone, who considers size the most important factor. Cost was about US$70.

****
Sony ICF-7601 - 2

In some respects this is my favorite radio. No bells no whistles no FM stereo -- just a good solid (feels like a small brick) analogue unit. It covers AM, FM and has 10 SW bands that cover most of the "out of band" frequencies. Band switching on SW is done by a slide on the front of the radio while buttons are used to switch from AM to FM to SW. The dial is accurate to 5 kHz so is very easy to locate a station. I believe that it was simply the best low cost analogue rig out there. It's still around and can be had for well under $100.00. Grab it!!

I have a 7601 also. Most of its weight is from the batteries and the speaker, giving it better tone and volume than smaller, lighter sets.

As with other cheap analog sets, it wasn't very hot out of the box.

If you "super tweek" the 7601, it's pretty good on AM, but no match for a 2010 or Superradio III. Most of the shortwave bands peaked up well, but I never could get 19 meters working right. As with most analog portables, the whip is part of the RF tuned circuit, so one must be careful to duplicate the exact listening conditions when tweeking the radio. Even the presence of headphones will shift the antenna tuning.

Unfortunately the 7601 picks up FM stations at various places on the shortwave bands. If you're far enough away from FM and TV stations you might have room for an R-390.

When going on trips I usually take my SW-1 because of the convenience of the presets and the reception flexibility provided by the active antenna that comes with it.

****
Sony ICF-SW33 - 1

I've owned this radio (SW33) for about 9 months and use it as my "carrying around the house rig." It was purchased to replace a Sony 7601 that now resides on my desk at college (things electronic can grow legs on a college campus). By far the best features of this unit are its convenient size and excellent performance on all bands, AM, SW and FM stereo. Don't get me wrong -- this is not a DX machine on SW but for listening to the major broadcasters, it's excellent.

The single filter selection seems just about right and tuning on SW is in 1 kHz intervals. This at least gives you a "fighting chance" to move away from interference. That's a major improvement over the 5 kHz that many radios in this price range allow. In addition, the dual conversion design on SW keeps image interference at bay - a major plus for a small portable.

The radio does not have a keypad so entering frequencies is a bit clumsy. However, by entering the middle frequency of each of the major SW bands in the 7 memories (5 memories plus 2 timer memories) and slewing up or down from those positions you can get around reasonability fast. The SW bands are changed by a combination of 2 keystrokes.

The sleep control (shuts the radio off after 1 hour) can let you be lulled to sleep and the timer alarm can make sure that you get to work on time (radio shuts down after 2 hours if it is turned on by the timer). Setting the radio alarm is very easy - once you have set the clock, but that frankly, is a pain. The clock function, which works very well (combination world/home time), takes at least 7 distinct steps to set it. Fortunately the clock is fairly accurate (looses about 0.2 sec/day) so you don't have to reset it very often. The lighted dial (stays on for 20 sec at the touch of a button) is a nice touch.

Battery life is excellent contrary to the 1994 Passport to World Band Radio (see below). The radio has a battery "gauge" that is

activated at the touch of a button radio and shows in the display
as a battery icon with 3, 2, 1 or 0 dots inside of the battery outline.
It disappears after about 5 seconds. As soon as the number of
dots reaches 0, the radio shuts off immediately. I ran a a series of
tests with Radio Shacks Super Alkaline batteries and got the
following results: 3 dots showed for 37 hours, then 2 dots showed
for an additional 11 hours, and finally 1 dot showed for 3.0 hours
for a total of 51 hours. (Radio ran 1.5 to 2.5 hours/day with the
volume control set at 1/2 volume most of the time). At $2.89 (plus
5% for tax) for a package of four AA batteries (the radio takes 3),
that figures out to 4.5 cents/hour which is excellent. This figure differs
greatly from that given in the 1994 Passport (25-30 cents/hour). I have
no explaination for the difference but I stand by my test values.

Would I recommend this radio to anyone? If you do a lot of band-
scanning, forget it; it will drive you crazy. But at about $140.00 plus
shipping (NYC mail-order) it's an excellent "second" radio to carry
around for listening to the major broadcasters. I like it!

****
Realistic DX-440 - 2

I have a DX-440 and I think it is a good 'dabble' radio but if I
ever get serious I will look for a > $500 table model.

I love this radio! It's my main radio and I use it
exclusively at home, moving it from room to room. It really is
too large for travel

I've found the sensitivity to be tremendous on SW, MW
and FM! Very rarely do I need to attach a clothsline
antenna! It has continuous SW coverage, a great sounding
speaker, BASS and Treble controls, two bandwidths, great
sensitivity, good spurious signal rejection...It has
all the features I wanted in a starter radio! I bought
it about three years ago on sale for $150.00! I still
don't know why Radio Shack discontinued it. If you're
looking for a good starter shortwave radio and can still
find one laying about at a Radio Shack store priced to move,
GRAB IT!

****
DAK DMR-3000 - 1

I bought this radio since they have a 30-day money back guarantee
and I did not know if I would like the hobby or the radio. Good
points: direct-entry tuning, 36 station memories, fairly small so
it is easy to travel with, speaker sound was good, reception was
okay, but improved dramatically with the addition of the Radio
Shack 23' rollup longwire ($8.95). Bad points: only 5kHz tuning
steps, only major broadcast bands tunable (large gaps between
bands), selectivity not so good, no fine tuning, no BFO, no SSB

or CW, poor FM reception. All in all, not a bad radio of $69.90, however, it left me wanting for more, so I got rid of it.

I have seen a couple of posts asking for a low cost SW receivers. I have recently bought a DAK Model DMR-3000, for just $69.90+$6.00 shipping from DAK - a mail order company.
The receiver has a direct access, so you can type in the desired frequency, and a manual / automatic scanning system. It also has a dual time clock with alarm and 'sleep' timer. Unfortunately you can tune only to the commercial frequencies on SW, AM and FM bands. I have to say though that cheapness comes at a price. The first receiver I got was defective so I had to ship it back and ask for a replacement. Now, I received a new one which works very well.

Compared to my Sony ICF-7601 the DAK unit is an insensitive brick. The fancy clock and timer features aren't really worth it. About the only thing nice is the FM Stereo support if you plug in headphones but the FM sensitivity leaves much to be desired as well.
Something else to watch for.... That pretty lettering on the buttons will wear off REAL fast. If you haven't used it much yet you won't see a wear off REAL fast. If you haven't used it much yet you won't see a problem. After you've done some tuning you'll see the pretty arrows disappear from the buttons.

****
Sangean ATS-803A - 1

Since I was now turned on by SWL'ing, I moved up to what most people agree is the best all-around radio for this price. Good points: excellent frequency band coverage (150kHz to 30mHz), fine tuning, good selectivity, BFO for SSB and CW, many scanning options, lots of accessories included, good AM and FM reception. Bad points: way too big to travel with, high battery consumption, synthesizer noise in background all the time, scanning frequently skipped lots of "listenable" stations that I was able to get by manual tuning (what's the use in scanning, then?). I found that adding a longwire antenna only increased interference and noise while not improving the set's scanning sensitivity. Overall, a fairly good radio for the price...

I have a Sangean ATS803A which I love. Comments to quote me on would be that it's an excellent beginner's radio for the price. Although I've heard that the 818 is the "latest and greatest" in this price/performance category. I especially love the full coverage 150kc-30mhz and the (albeit lo tech bfo) SSB capability.

****
Sony ICF-SW20 - 1

I was in dispair when I could not find a decent travel portable for under $200. However, I accidentally crossed paths with a Sony ICF-SW20 on sale (normally $99, on sale for $49.99) at a local store and had to check it out. It is an analogue set, but since I got a 30-day return policy on it, what the heck? Good points: analogue tuning so no problem with confining 5kHz tuning steps, INCREDIBLE SENSITIVITY - this radio blew the DAK and Sangean away with the number of stations I picked up, good selectivity (no fine tuning knob - all you need to do is turn the tuning knob slowly), tiny size (4"w x 3"t x 1"d), small whip antenna (only 18"), addition of Radio Shack rollup longwire increased sensitivity even more, great low price (if I lose it or its gets destroyed, no problem replacing it), tuning bands are wider than the major broadcast bands, so you do get some utilitiy reception as well as WWV, AM and FM are really sensitive while FM goes from 76mHz to 108mHz so I can pick up some TV as well. Bad points: frequencies cover only seven broadcast bands (I can live with that, though), only monaural earphone included (however, you can get a $1.39 mono to stereo headphone plug), no BFO for SSB or CW, no station memories. All in all, this radio gave me the best price/features/size ratio of the ones I checked out first-hand. It's a keeper for me!

****
Magnavox 3625 - 1

Finally received my Magnavox 3625! Well, I'm certainly happy I purchased this little radio. Sure, it's not top shelf, but it's suitable for travel purposes and gives adequate SW coverage.

Has these features:
Travel Lock
Alarm (beeps, does not turn on radio)
Sleep Timer
9/10 KHz switch - for world travel
12 hour clock (however, when unit is swith to 9 KHz steps 24 hour clock kicks in)
20 presets - 5 for each band FM, AM, SW1, SW2
Dual time
Auto store - this feature allows the radio to automatically find the five strongest stations in an area and program
them into the memory of the FM & AM band.
Back stand
Antenna swivels and rotates
Runs on four AA batteries.

Well, the sensitivity is quite good. Steps in 1 KHz increments. No tuning knob but the slew tuning buttons work just fine. It's about the size of a paperback book and can be taken anywhere reasonably well. No carrying strap,
though. The SW coverage is limited but it grabs the major broadcasters exceptionally well. Example: the 41 meter band is

covered from 7100 to 7300. So if you want to listen to the BBC on 7325, you're oput of luck.

However, I like to listen to the BBC on 12095 or 15070 European signals during the day that I cangrab when I attach a long wire. The 3625 can't tune these freqs. but it can grab 15400 (from africa) WITHOUT a long wire antenna! I'm pretty impressed.

Bottom line....A GREAT little travel radio for $70.00! Call a Magnavox outlet if you are interested.

****
Magnavox AE-3805 - 2

Great little digital portable. Good sensitivity, average selectivity. Covers MW (in 10 kHz steps only), FM (no stereo), and SW in two "bands": 3200-7300 kHz and 9500-21750 kHz. Built-in timer/clock (12 hour format only), 5 programmable memory locations per band. Great for travel use.

Purchased from Damark for $49 in May, 1993.

$50 from Damark closeout -- cheapie category

****
Emerson PSW-4010 - 1

Great analog portable. Good sensitivity and selectivity. Covers MW, FM (stereo through headphones), and SW in 8 bands (roughly split out as 13m, 16m, 19m, 25m, 31m, 41m, 49m, and 60/75/90/120m). An excellent travel portable.
This is the same radio as the Sangean SG-789.

Purchased from DAK for $49 in June, 1988.

****
Sony ICF-5900W - 1

Sony ICF-5900W was a good radio in its day, but isn't worth listing now.

****
Icom IC-R70 - 1

I purchased my R70 in early 1983. It came with a scratched plastic window for the digital display, which the factory replaced. It is an extremely sensitive receiver. I installed the FM detector board option, which is highly useful for Sub-Carrier detection from FM broadcast receivers in conjuction with the R70's ability to tune below 100khz without a frequency convertor. The so-called PassBand Tuning (PBT), in actuality an asymmetrical bandwidth narrowing control, is very mediocre with the factory 455khz filters. Replacing the 455Khz ceramic SSB filter with a Fox-Tango FT-44 2.4khz 8-pole crystal filter (equivolent to the ICOM FL-44) makes the passband

filter work as one would want. The AM 455Khz ceramic filter is junk,
and was replaced with a higher quality "4Khz" ceramic filter from
the long-defunct Radio Plus firm. The actual specs for the 4Khz filter
indicate that it is a slightly asymmetrical filter of 5.6Khz bandwidth,
causing a slight degredation of the "highs" (The original spec is
for a 6Khz bandwidth; the 9Mhz AM filter is a 6-pole device). Inclusion
of both replacement 455Khz filters results in a combined shape factor
of much better than 2:1 on AM or SSB. In addition, the RF amplifier
was enabled for AM broadcast band use, and an MOV was placed across
the AC input for protection against voltage transients. [Actually,
a Transorb would be far better in defending against narrow transients.]
For awhile, I replaced the diode AM detector with a Shottkey diode,
but my ears could detect no difference in distortion, and so the
original AM diode was returned to the circuitry. It's been serviced
once by ICOM for an intermittant problem ($150 ouch). There exists
several modifications to enable selection of the 455Khz SSB filter
whilst in AM mode for additional selectivity.

YORX AM908 - 1

****
Drake R8 - 1

****
Drake SPR-4 - 1

****
Icom R-71A - 2

Eskab & Edvis of Sweden used to offer a Phase-Locked AM (PLAM) detector for
the R-70 and later R-71; they also offer a version for the NRD525. I have
the R71 version. It is a synchronous detector which allows selection of USB
or LSB via the IF filter/BFO offset. The PLAM board phase-locks one of the
R71 local oscillators (I forget which one, probably the BFO) to the AM
carrier. It contains its own product detector. The lock range is not very
large, perhaps +/- 20 Hz. The detector seems to have lower distortion than
the ICOM AM detector.

Compared to ECSSB, aside from the advantages of phase-locking the product
detector BFO, the PLAM unit also lowers the corner-frequency of ICOM's
low-pass audio filter, giving better bass response than normal SSB mode on
the R71. I find that this improves the intelligibility of the signal.

The PLAM board piggybacks in the mounting area for the ICOM FM option
board; both can coexist. Installation is somewhat difficult, as it involves
connecting over a dozen wires to various boards in the R71.

Eskab & Edvis also offered a 4 KHz 2nd IF crystal filter for the R71. This
installs fairly easily in place of the narrow CW filter. It is very much
better than the stock ICOM 6 kHz bandwidth, which is wide-open until it
hits at cheap ceramic filter in the 3rd (455 kHz) IF.

I don't know if Eskab & Edvis still offer the R-71 PLAM and 4 kHz filter.
They used to advertise in the WRTH.

Regarding other options: I believe Sherwood Engineering offers an outboard
synchronous detector for the R71 as well as other receivers. The Kiwa MAP
unit should also be adaptable to the R71.

Also, Dom Moman of Shortwave Horizons publishes a modification manual,
which details mods like enabling the preamp on MW, true pass-band tuning,
sub-10 Hz RIT, etc.

****
Kenwood R-2000 - 1

****
Kenwood R-5000 - 1

****
Kenwood TS-450-1

I know it's not a reciever, but since it has general coverage,I decided to
put it in here.The TS-450S is an amateur transciever that costs little more than
a R-5000,and if you have your ham ticket or are thinking about getting it,may
be worth checking out if you are in the market for a new toy.I'd be willing
to bet the replacement for the 5000 will look just like the 450,just like the
5000 looks like the 450's predacessor,the TS440S.First thing it is EXACTLY
the same size as the 5000/440.Unlike the 5000/440,it has an LCD display that
is unlike any other I've ever seen.It is almost too bright!The brightness
cannot be adjusted,unfortunatly.The 450 recieves in all the standard modes
except for fax.It has a"normal"keypad unlike the 5000 and the aggravating
CW that is produce when a major button is pressed can be silenced by y
-a simple menuss,you dont have to cut a wire like the 5000he S-Meter
is a bar-graph type that I like but some people dont.It also has an Audio
meter function that kin baffles me.I still dont know what use it is,but it
looks nice!Probably the most notable thing you will observe when using the
450 is the QUIET!It is so quiet,it seems strange the first couple of times you
use it.The AGC is non-defeatable and has a fast/slow toggle.It is the strangest
and slowest AGC I've ever seen,on slow the S-Meter just sits there and then
SLOWLY goes down.On fast,it just isn't quite so slow.It seems to work ok,but is
really odd.The stock filter for AM is a mile wide but you can add the YK88 AM
filter but you wll lose the open slot for the 8.83 ssb filter.I'm not sure,but
the 450 seems to have the same stock am filter the 5000 has.On SSB,it uses one
of the better Murata ceramic filters and is ok but the optional SSB filters are
highly recommended.The audio is FANTASTIC on all modes and if you put one of
the minimus speakers from Radio Shack on it,you will like it a lot.Dont bother
with the Kenwood speakers,the one that goes with the 450 is not too good and is
expensive too!The ergonomics are pretty good,except for the tuning knob,yes
like all the recent vintage Kenwood rigs,IT DOESN'T HAVE A FINGER HOLE!!Why
does Kenwood insist on putting these awful knobs on all the rigs they have made
lately!All in all,it is a very good riever in almost all respects,and since t
it only costs about $100 more than a 5000,it is worth a lookND as a bonus,
the recieve coverage goes up to 40 mhz!If you are into low band scanning,you
will hear things on the 450 you never knew existed on your scanner.If you can

swing the 450's sister model the TS690,you can recieve all the way to 60 mhz. When the 5000 is put out to pasture,if it's replacement is the 450 without the transmitter,it will be very tough competition for the other makes.All it needs is Sync.detection and you really couldn't ask for much more.

****
Japan Radio Company NRD-515

THE all time most user-friendly recieveof recent vintagHas PBT,analog fine tune,four I.F.bandwiths,AM,LSB,USB,and RTTY modes.There is no squelch but it really doesnt matter much.Of all the recievers I have owned,or ad over here to play with,it is the most sensitive in the SSB modeI have the standard 6 and 2.4 khz filters,and th600 and 300 hz filters whitch are great for RTTY or CW(if you are truly desparate!)The "protection"diodes have been removed due to intermod from a local AM station.The reciever's case,front and back panels are made of Aluminum,no plastic to crack on the 515!The audio in AM is very bad,almost as bad as the Icom R-71a,but in a different way.The audio is "fuzzy"out of the speaker jack,but not too bad out of the record jack but still a little "fuzzy".In the SSB modes,the audio is pretty clear and doesn't fatigue me like the Icom dos far as thergonomics goes,it's almost prefect!All the knobs are the right size,the tuning knob is large and has a nice deep finger hole(Kenwood,are you listening???).The S-meter is big and easily seen across the room.Dynamic range is very good after the diodes have been clipped(a one minute operation).The filters all are good quality and have good shape factors.This was the first "affordable"rig that had a memory option that was worth something with 24 or 96 channels available. The NDH-518 I have(96 ch.)is also made totally out of cast and sheet aluminum and matches the 515's styling.It stores frequency only,unfortunatly, due to the year it was designeIm guessing.There are lots of these recievers floating around on the used market for about $600 or so.Universal seems to have a lot of them passing thrgh the store.

****
Japan Radio Company NRD-525 - 1

This is a great reciever,marred only by bad audio and a hiss that will drive you bonkers if you have good hearing and a speaker that can put out the highs. I have had two of these,the first I traded for a sateite setup,and the one I have now.The newer reciever has mucbetter audio then the first one and lesess hiss too.Ergonomics are very good MUCH,MUCH better than the Drake R-8.(IMHO,the Drake is seriously overrated and all the stuff about made in the U.S.A.is kind of funny cause a LOT of the innards are MADE IN JAPAN!!!)Oh well,back to the 525,if you are into AM,it's probably not the reciever for you, but in allthe other modes,it is one of the best consumer grade recievers ever made.Performance in all modes is basically excellent except fothe audio pr problem,and stability is rock solid.JRC has only cut a few corners compared to the 515,probably the ultimate in construction for consumer recievers. The case is made of very thin sheet metal and the front panel is plastic.The keys fit loose in the keypad but work ok.The display has four brightness levels and is very easily read from across the room.The S-Meter is "digital" and is a floating vertical bar segment that seems to be yellow on some samples,

and green on some others.It is sort of "spastic"and twitched a lot on the
first one I had,but not as much on the seconone.The first 525 I had would
"click" on strong AM signals,but the new one doesn't.The main tuning knob
spins very smoothly and has a nice finger hole.(KENWOOD,WHY DONT YOU LISTEN!!)
All in all, a great reciever.

****
Japan Radio Company NRD-535D - 2

I have been using a NRD-535 for two years and i am very pleased
with it. Although the relative high price makes this a radio
for the serious DXer and maybe not the average Shortwave listener.

The NRD-535 has very good ergonomics. It is very easy to operate
during long listening passes. It has 200 memory channels which comes
in handy for storing interesting frequencies that you want to
check later, or stations that you want to check regulary.

+ side:
On the plus side there is the BWC and the very good sensitivity.
The BWC combined with the PBT makes it possible to make
a station readable that is very close to another station, or
a interfering RTTY transmitter. I find that i mostly uses
the SSB mode and zero tunes the station, and then uses the
BWC and PBT to get the most readable signal. The BWC and
PBT has saved a lot of reports for me. The sensitivity
is excelent. It is among the best in this price class.

- side:
The audio in the built in speaker is mediocre to put it mildly.
A station that you read loud and clear in the earphones can be
inaudible in the built in speaker. The selectivity is not as
good as it could be. The NRD is very sensitive for splatter from
nearby stations, and this can totally drown the station that you
want to listen to. The ECSS option that you can equip your NRD with
is a joke. I have it installed but i NEVER uses it. The only time
you can use the ECSS with any improvement of the signal, is if the
received signal is strong to begin with. Don't waste your money on
the ECSS.

The conclusion is that the NRD-535 is a very good receiver for the
serious DXer but it has some shortcomings. The 535 is much better
than the Icom R-70 that i had before, and i would recommend it to
anyone that asked me. What you might want to do is change the filters
to somewhat sharper filters. That goes for both the 9 MHz and the
455 kHz filters.

****
Yaesu FRG-100 - 1

****
Panasonic RFB-65L - 2

$220 from Universal, EEB, etc. -- my main set, an excellent
portable, many features, nice construction and details.

****
Sony SW-55 - 2

This is my principal radio at the present time (I also have the
Sony ICF-SW33 and the Sony 7601). This rig is an extremely
sophisticated piece of equipment. I especially like the fact
that you can store up to 125 frequencies on 25 electronic pages
that can be named as you wish (by country). Once programed this
is very convenient. The two filter selections are well chosen
(much better than the stock Sony 2010 filters). My use the radio
to copy WEFAX with excellent results attests to its stability
(and that it receives USB and LSB).

The versatile timer/alarm and tape remote feature allow
automatic recording with certain tape recorders (Sony and others)
of up to five times and frequencies in a 24 hour period. I use
this feature all of the time. Audio (stereo on FM) qualitity for
a portable is very good; better I believe than the stock 2010
although as with the 2010, it is improved with a set of external
speakers.

Unlike the 2010, the SW55 does not have synchronous detection.
That's too bad because I believe that if it had this feature it
would blow away
tition. As it stands it is an excellent radio. Most
interference can be eliminated with the narrow filter or moving
away from the interference a bit (the radio is tunable in steps
of 0.1 kHz) so the lack of sd is not critical. I really
believe that Sony did not include it because it would have then
had a very negative impact on sales of the SW77.

Would I buy this radio again. You bet! The only problem I've had
in the year an
owned it is that the lettering has worn off the 1, 5, 0 and EXE
keys on the keypad. That should not happen on a $300.00 radio!

I just got a SW-55 for Christmas and find it to be an outstanding radio. Now
that I've said that, you should know that I am new to all of this "DX-ing" (is
that how you say it?). However, I can tell you that it's reception with the
built-in antenna and with the included auxiliary antenna is very good. I found
that the radio comes pre-programmed with a number of stations (BBC, Radio
Moscow, etc.) and they come in great.

As for your questions, I've found the speaker in the SW-55 to be very high
quality, delivering plenty of volume and good sound. There are several "tone"
switches (news vs. music setting, etc.) that enhance the reception and its
sound. And, the unit is packaged well for travel.

The radio itself has several nice features (I don't know how they compare to
other radios since I didn't comparison shop). There are several output jacks
that make it easy to connect to external speakers, tape recorders, headphones,

etc. There are local/long distance antenna settings. There are lots of ways to set and look at the time (local, UTC, Daylight savings, etc.) There are alarms and sleep settings (for on the road).

The tuning portion is quite nice. The radio of course offers digital tuning (punching numbers in to get to a freq.). But I find that I often use the "analog" tuning dial as well to either fine tune a station or to see what else is out there.

Best of all, the unit is packaged well. As a new user, I have enjoyed the little things Sony has done to make this experience a good one for the new user. Everything from the documentation to the carrying case has made it quick and easy for me to start listening to short wave. Included is a book that is a publishing of all the various countries broadcasting, with their freqs and times. (I gather that these things change quite a bit, but I presume that Sony updates it often)

****
Philips AE3905 - 1

In short, in my experience, the AE3905 is no real great shakes. It looks neat as hell, and marks its owner as a man of taste and distinction with more money than brains (like I said, *I* have one). Its shortwave performance is mediocre. Using this in a hotel last February, I found that attaching the included reel antenna caused the radio to overload fairly badly. The batteries don't last very long. The filters included are fair, but you still get a fair amount of interference from adjacent stations (not as bad as some small portables, but not good). I certainly wouldn't want to use this as my primary radio. For portability, it's fantastic. I can listen to the BBC or VoA anywhere. The radio fits in my shirt pocket, although reception in my pocket isn't all that good. In short, the radio isn't worth what Philips charges for it, but if you've got more money than you know what to do with and a desire to have a flashy looking toy, it'll do. The radio has only recently been available in small quantities in the U.S., and appears to have been discontinued in Europe. I got a reconditioned copy for $179 from the Magnavox factory outlet in Kentucky. Universal lists the radio in their catalog for something like $250 new if I recall correctly. You're not likely to find it anywhere else.

****
WATKINS-JOHNSON HF-1000 HF RECEIVER

I will be doing a lot of comparisons to my other receiver, an NRD-525. To give a basis for comparison, the NRD-525 has been upgraded by the following modifications:

ESKA PLAM board with four added filters following the IF strip
Installation of ESKA Aux filter in the NRD Aux position
Installation of the JRC 1.8 KHz filter in the Narrow position

Replacement of RF chokes on the filter board with shielded units
ESKA agc modification

These modifications have improved the shape factor on the NRD's filters from an average of 2.0:1 to 1.7:1 (60:6 dB). The ultimate rejection has improved from about -60 dB to -75 dB. These modifications are noticeable in on the air listening tests. The NRD hiss has been removed.

About two months ago, I bought another receiver, a Watkins-Johnson HF-1000. I didn't really think this receiver would be much better than the NRD, and I intended to return it if this was the case. I was wrong. The Watkins-Johnson receiver is clearly superior to the NRD in on the air listening tests, almost in every case. In rare cases it is a tie. The comparisons are done using an A/B switch that switches both the RF and audio lines so that comparisons can be made quickly on the same signal. Comparisons were all done in ECSS mode with the receiver settings made as close as possible to each other.

I also did some bench testing of both receivers, and the numbers that the tests give are not all that much different for both receivers, with the exception of filter shape factor. The HF-1000 shape factors run about 1.1:1 (60:6 dB). This does not explain the main difference between the comparisons, however. The HF-1000 seems to be superior in pulling out weak signals. I have heard many signals that are muddled and hard to understand on the NRD-525 sound sharp and clear on the HF-1000. Several other points:

AGC: The digitally processed AGC on the HF-1000 is far superior to the analog AGC on the NRD, even with the ESKA kit installed.
Notch filter: Again, the digital IF notch filter is superior.
Audio: The NRD audio has always sounded low frequency and mushy; audio on the HF-1000 is crisp and clear. This is an important item.
Operating: I like the controls on the HF-1000. They are flexible, yet easy to use. The set is a pleasure to operate.
Synthesizer spikes: The NRD has a synthesizer spike every 100 KHz. While these are not all that strong, some of them fall on inconvenient frequencies, like the propagation beacons on 14100 KHz. There are a few spikes on the HF-1000 at even 2 MHz points.

The only shortcomings in the HF-1000 I've noticed are the lack of synchronous detection (this is supposed to be sent out as an upgrade chip later), and IF passband tuning would be useful in the SSB modes. It is present in CW.

As you have probably guessed, I'm real happy with this receiver. I think it will be the last one I will have to buy for quite a while.

Watkins-Johnson HF-1000 Review Part 2

Watkins-Johnson SAM option for HF-1000

Recently I received the firmware for installing Synchronous AM (SAM) detection in my HF-1000 receiver. I was able to install it in about 1/2 hour and it worked great. In testing it I compared it to the

ESKA phase lock AM board installed in my NRD-525. Here are the results
for strong and weak signals:

Parameter ESKA+NRD HF-1000+SAM
--------- -------- -----------
Weak signal lock range +- 20 Hz +-250 Hz
Strong sig lock range +- 40 Hz +-900 Hz

As an on-the-air test I tried to lock onto Radio Pyongyang, 13760 KHz at
1300 UTC. The signal was weak and fading rapidly at 1300 UTC and was being
broadcast on 13760.1 KHz. The HF-1000 was able to lock it immediately even
when set to 13760.000. NRD was not able to lock it at all, even when set to
13760.1. Impressive!

Another modification in the new firmware is a change in the AGC function.
It is now possible to set three decay rates from the front panel for each
AGC setting, Fast, Medium and Slow. In addition it is possible to allow
the manual gain setting to control the AGC threshold while in AGC mode.
This is a great help for the AGC control. I spent many hours trying to
get the AGC decay rates correct on my NRD receiver, and was never happy
with that AGC. This required pulling out the IF board, replacing some of
the SMDs, putting it all back together, and then trying it. Digital AGC
processing on the HF-1000 makes this a snap, taking only a few seconds.

After several months of using this new mode of reception, it is the one
I nearly always use for SWLing and DXing. For weak AM signals it is hard
to beat. If the signal is readable at all, it will be able to lock on it.
By using both sidebands, you end up with a better signal to noise ratio
than with only one sideband. The HF-1000 is even more impressive now
with this addition. The only times that I have had to resort to ECSS on
AM signals is when there is interference on one sideband. Watkins-Johnson
reports that they will have single sideband SAM in the future which will
get around this. There are several other options that they are working on,
one of which is a plug in board for PC processing. I assume this will have
real time spectrum analysis and memory functions built in.

****
AR3000 - 1

My general impression, is that this is anyhow a very good apparate. It
offers continuous coverage 0.1 : 2036 Mhz, all mode, RS232 interfacing,
quite good operating commands, triple conversion, 400 memories; it is
very compact (small tabletop, 1.2 Kg.), semi-portable; its 13 auto-selected
front-end band filters reduce to some extent unavoidable intermodulation. In
general, this set offers a self contained and very well balanced compromise
of a lot of different demanding features, but will show its best when fully
interfaced.

Its price, here in Italy, has been varying greatly during the years.
Therefore I cannot say how it really competes with the choice of HF
receiver + scanner setup. It is still unclear to me how far is the AR3000
from dedicated traffic receivers.

I'm finding a number of defects and "whish it was" that I'm going
to list (I would like to hear comments about), but perhaps I'm
just pretending too much from a receiver in which something had
to be traded off between versatility and performance. Please note
that I have a 4 years old AR3000; some defects could have been amelio-
rated in the 3000A, or may eventually be specific of my unit.

Hardware limits:

-AM selectivity is mediocre (approx 10 khz bandwidth). I feel the lack
of a variable Am bandwidth. SWL in crowded bands is too often spoiled by
the 5Khz whistle. Thinking it was a problem of i.f. detuning, I once
sent it to the service to have it retuned, but with no perceivable gain.

-In AM I do experience blocking. A strong transmitter mutes any weaker adjacent
signal lying some -+30 khz apart. I suspect this may be rather a problem
of AGC voltage (see below on squelch), because the feedback signal is
obtained from the previous to the last i.f. stage, which may have a larger
than necessary (for AM) bandwidth.

-The squelch control (essential in search mode) is not very functional.
On my set almost everything passes for knob positions below .3 and
only >S6 passes when I increase to .5. It may be a problem of adjustment,
but also reflect the inaccurate behaviour of the S-meter, which (I have
no measurements to support) seems not properly logarithmic. I have
the impression that weak signals give a high S readout when close to
stronger ones, because the S-meter averages on a larger bandwidth than
the demodulator.
Also, the squelch just mutes the a.f. output, but not the line out signal.

-The internal speaker fidelity is scarce. No tone controls exist. Clarity
improves a lot when connected to an external speaker or lineout. No
noise reduction circuitry is present. External audio equalization does
a lot, but of course is not the cure for low selectivity.

-There is no i.f. direct output for say a spectrum analyzer or a different
demodulator (say wide band AM for satellite or TV, stereo FM decoder,
sinchro SB AM decoder). A modify could be to buffer it to a backpanel
jack.

-Intermodulation IS present. I live very close to power MW transmitter,
and in the times they're on the whole band .5 : 2.5 Mhz is unusable,
with crosstalk on every possible combination of transmitter frequencies.
At evening I sometimes hear sw bc stations crosstalks on 20 : 30 Mhz, even
with a short random wire antenna. However, I don't hear crosstalk due
to FM transmitters, which are also close to my place. The 13 front
end filters seem to do their job, since strong signals don't cause
crosstalk out of their respective preselector bands.

-I'm not very satisfied with the small and clicking rotary tuning control. In
the AR3000a it has been replaced with a (I guess optically encoded) smooth
one. I would rather appreciate a jog-shuttle like the one on VCRs, and the mod
itself seems quite easy too.

The tuning is however digital, and stepping frequency causes clicks, which eventually trigger the squelch threshold during search. The final a.f. is briefly muted while stepping, but I prefer the line-out signal which is unaffected and thus has a faster response.

-There is a single antenna input for the entire range. I think this however is correct, because whichever choice on different antennas is entirely dependent on the user setup, and should be rather left to an externally programmed antenna switch.

-Some digital RFI is generated, expecially in the high HF and low VHF. A real antenna connected with a shielded cable and a good earth however wash it out.

-Some small change in sensivity and background noise can be perceived when passing across one of the 13 band boundaries (by the way, they are 0.1-0.5, 0.5-2.5, 2.5-10, 10-30, 30-50, 50-108, 108-136, 136-174, 174-224, 224-335, 335-500, 500-940, 940-2036 Mhz), but this is unavoidable, and also due to the change of the superetherodyne scheme.

Software limitations:

-Scanning is already very versatile for such a small machine. However, auto memory storage of catched frequencies was forgotten. Also, the oddities in the S-metering (see above) impose manual choice when scanning non regularly channellized bands.

-There is a priority channel lookup feature, but the attention threshold has to be the current squelch position. Apparently (see
//ftp.funet.fi/pub/dx/receivers/mods/aor300.mod) in
the 3000a a programmable lookup time was implemented, but it is not present on the 3000.

-The mode and the tuning step change are set with several keystrokes. I feel it quite tricky, expecially considering that I generally have to switch quickly between 50 Hz/SSB, 500Hz/Am, 1.25 Khz/nfm, 50 Khz/WFM. The step x10 command is very useful, but not enough.

Since the S-meter signal is output on the RS232, and the unit may be fully remotely commanded, all this limits can be cleverly threspassed by an external control software, thought.

I have experienced problems with the 232 interface. The cpu goes crazy very easily when the connector is plugged in/out, unless the "remote" switch on pin 7 is previously operated. This is (I understand) the reason why it was added on the 3000a. When the cpu goes on the moon, one generally has to open the set and to push the reset button (backside of the keyboard), losing all the memories
.
Also, I cannot interface the scanner with an Atari St, either because the TTL level Txdata is to low for that serial port or because the continuous output of the S-meter simply is too fast for the Atari bios.
Passing by, note that the RS232 speed can be set to 9600 baud with a switch on the cpu board.

2666. AR8000 AUDIO SCAN problem?

Newsgroup: rec.radio.scanner
Date: 1995-03-02 15:22:18 UTC
From: mike@shien.ist.csuohio.edu
Message-ID: <1995Mar2.152218.27679@news.csuohio.edu>
Source record: 260864

Fellow AR8000 owners,

I've heard various reports that the AUDIO SCAN/SEARCH on some units
is not working. Is there a way to definitively test this?

I did the following, and suspect that the AUDIO SCAN/SEARCH on my
unit is also not working. I have serial number 011412, and I
saw a rec.radio.scanner posting wondering if units with
serial number below 20000 might have the problem. Anyway,
here is what I did to test it:

Test 1: I have the 40 CB channels in one scan bank. I set
AUDIO to "ON". I go to a CB channel on my CB, and I can
key the mike so that all I get is a dead carrier (I push
it further and the mike kicks in, but luckily I can just push
it part-way and JUST the CB transmitter goes on, but with a
dead carrier, no audio). Well, the AR8000 stops scanning on that
CB channel as it should, but just stays there, and does not continue
(as you would expect with AUDIO ON and a dead carrier).
To be sure, I shut the CB off, and the AR8000 continued
to scan as you would expect (because there is no
more signal). So, I went back and checked the AUDIO SCAN
setting, and sure enough, it is still set to ON (also is
set to ON for AUDIO SEARCH, by the way, so I did not get the two
confused).

Test2: I put together a few unused FM broadcast frequencies
into a bank. And, made sure the AUDIO was ON. I have the Silent
Play gizmo from Radio Shack, it allows you to broadcast
over low-power FM, things like game video audio and so forth.
It comes with a regular FM reciever too, so you can listen
to what's coming from the transmitter. The transmitter
can be tuned between about 88-93Mhz on the FM band. So,
I match the Silent Play transmitter to a frequency I dialed
into one of the AR8000 memories, until it pegged the AR8000
signal strength meter with a full dead carrier (I did this simply
by not plugging anything into the audio input on the
Silent Play transmitter). In any case, I had a full-quieting,
nice clean dead carrier. I put the AR8000 in SCAN mode over
that bank, and sure enough it stopped on the dead FM carrier
from the Silent Play. Well, unfortunately it did NOT move
off the carrier as you would expect with the AUDIO set to ON.
To verify, I did go back and check, and yes, the AUDIO
was still set to ON (in fact, it was on for both SCAN and SEARCH).

Is there a possibility that a real strong signal (like from a
nearby CB or even a little FM transmitter) can cause normal
AUDIO SCAN/SEARCH to be inoperable because the signal is
so strong (even though the carrier has no audio present)?

I suspect that the AUDIO does not work on my unit. I'll
be getting back to the people who sold it to me, since they
said this problem was fixed on my unit (got it in Canada).

Anyone else?

Great story! Thanks for the post. Enjoy your new scanner!
I bought an AR8000 with the intention os selling my Pro 43
but I find the 43 hard to part with. I guess my credit card
payments will just have to wait.

Wow ! well that worked so well I'll try one more shot.

I have Police Call (1995) and it has the Freq's for Webster PD, the problem is after listening to the stations, there is no way it's Webster I hear disp. calling units to street names in downtown Houston. My guess is thats it's the Harris County Sheriffs Dept. who does cover Webster.

I found the VFD and Southeast (Webster) EMS but absolutely no luck with Webster PD.

Anyone ????

thanks again....
Scan ON !!!

2672. Re: Cellular phone channels and frequencies

Newsgroup: rec.radio.scanner
Date: 1995-03-02 17:38:18 UTC
From: horak@convex.com
Message-ID: <3j4vqa$o6u@eugene.convex.com>
Source record: 260820

In <3io9uv$82i@usenetp1.news.prodigy.com> XHCJ28B@prodigy.com (Michael Rothermel) writes:

>Would anyone out there care to explain to me how cellular phones work ?

Full duplex. Handheld unit 45 MHz below the base frequency. Handhelds
are anywhere from milliwatts to 3 watts, controlled by the base.

>How far is the range of a cell, and how many channels are there in each one?
>Would one phone be pre-disposed to use certian channels, or is it random.

Depends. Functional range is about 1-5 miles on average.

>Are certian channels inheritly stronger within one area of a cell

Not really but certain cells are "stronger" than other ones.

>Is it possible for one phone to be on two channels at once, or just when
>it switches cells ?

Only one channel at once. If you mean two *cells* at once, you might try
using your cell phone in an airplane and see what happens! :-) :-) :-)

>the extended cellular frequencies? I have several charts
>that show frequencies by cell, but none of them include
>frequencies above 890. I know what the frequency range is
>but I need to know which frequencies are assigned to each
>cell.

I don't have the info with me but basically, 869-870 is non wireline.
890-891.5 is non wireline. 891.5-894 is wireline.

I didn't have the data for the cell you listed but I do have data for this cell, since it is the local cell site near me :-) You'll notice that it is still the 630 KHz spacing. By the way, the control channels aren't always the same here in my area. In other words, Channel 1 for cell #18 *may* not be 880.530. In this case it is 880.050. Hope this helps.......

Cell # 18

Channel 1 (351) Tx 880.530 Rx 835.530

Monitoring Times
Reoring Times
Reprinted by: John Johnson KWV8BP

Business radio service frequencies are in heavy use, with some crews using
multi channel radios. It might be a good idea to see what the search/scan
feature of your unit will produce for you if you let it sift through the
following bands:

151.625 to 151.955 462.550 to 462.9125
154.515 to 154.600 463.200 to 464.9875
457.5125 to 457.6125 465.6625 to 467.1875
460.6625 to 460.6875 467.550 to 467.9125

460.9125 to 462.1875 468.200 to 469.9875

Also make sure to check these frequencies:

30.84 457.60
33.14 464.50
33.40 464.55
35.02 467.75

Scott et al.,

I dug these up from my files. I'm sure they're way outdated, but some of
the network and official freqs might not be. This is Racing stuff I have.
I don't know if NASCAR is Indy etc. (actually know that I think about it
Nat. Assoc. Stock CAr Racing(?) doesn't sound like the funny cars at Indy ;) but
any way....I'm sure someone can use them. I found the AVS stuff interesting
and it's probably useful to all if it isn't dated. Anyway......
If you get any *real* answers, please post them.

Carter

PS---I have no idea who the original posters/writers......

Misc Freqs
AVS RACING

Aerial Video Services, out of Burbank, California, is
major supplier of the in-car cameras, wireless cameras
and communications links for the television coverage of
auto racing and other sporting events. During a recent
racing series at the Texas World Speedway, AVS provided
the microwave and communications equipment for the Prime
Network television coverage of the races. I had a chance
to work with the AVS crew, and check out their radios.
If you get to attend a sporting event where wireless
cameras or mics are in use, you might check out some of
these frequencies.

Let me explain a little about the equipment they are
using, and what you might hear. Any time there is a
wireless camera in use, they will be sending the
pictures from the roving camera location to the TV
remote truck on a microwave link. They may use the
2 to 2.5 gHz or 7 gHz microwave bands. In addition to
pictures from the camera, there has to be voice
communications to the cameraman, and sound from the
announcer's microphone, who may appear on camera, and a
cue channel to the announcer, so he knows when he is on
the air. The communications from the TV director to the
cameraman are usually referred to as the "PL". This
stands for "party line", and is a two-way communications
link with the director and the camera operator. It is
usually set up as a low-power repeater, so you will
always hear the directors calls, and the camera
operators replies. The cue channel to the announcers is
called the "IFB", which stands for "interrupted feed-
back". This is usually the audio from the program that
is being produced, along with the director or producer
interrupting the program feed, in order to give cues to
the announcers. This transmitter will be on as long as
the TV production truck is operating.

AVS uses mostly I-COM programmable radios. Here are
frequencies that are programed into the units...

Channel Frequency
1 457.525 - This ch.used for IFB 10/18,19
2 457.550
3 457.575
4 457.600

5 467.750
6 467.775
7 467.800
8 467.825 - Car camera control data
9 467.850
10 467.875
11 467.900
12 467.925 - AVS tech communications
13 467.7375
14 467.7625
15 467.7875
16 467.8125

They also have radios programed in the 450 - 455 mHz Broadcast Remote Pick-up bands. At the racing I attended they used 455.350 as the P.L. communications to the pit camera. 450.350 was the input frequency to the repeater. Why they used the frequencies "backwards" from what the normal repeater frequency scheme would be isn't known. The car camera control data uses a 10-watt base station that transmits control tones to the cameras in the cars. You will hear a continuous carrier with DTMF (Touch-Tone) audio tones as the commands are sent. The microwaved pictures and sound from the in-car cameras are beamed up to a helicopter that has a microwave receiver on board, and then re-transmitted back down to the TV production truck on another microwave frequency. The TV truck used 123.050 to talk with the helicopter.

The wireless mics that the roving announcers may use are Sony UHF mics in the 950 mHz band. Here is the channel allocations for the USA.

Channel Frequency
11 947.250
12 948.250
13 950.250
14 951.750
15 949.000
21 947.750
22 949.750
23 950.750
24 951.250
25 948.500
31 949.250
32 948.750
33 950.000
34 951.500

Also, for you race fans who may end up at some SCCA racing events, here are some assorted track frequencies

in use at the Texas World Speedway, in College Station,
Texas.
151.625 - SCCA Race Control Primary
151.685 - SCCA Secondary
151.715 - SCCA
464.500 - Texas World Speedway
464.550 - Texas World Speedway

Other events could use same freqs for wireless cameras.

More Auto Racing Freqs

Victor,

Here are two list of NASCAR frequencies. I take credit for
neither. The name of the author of the first listing is unknown to
me. Robert Ford posted the second listing a while ago here on
USENET.

Regards,

Kevin

Note: If whoever is covering the race is not on the above frequencies,
try using the search function on your scanner between 450.00 and 470.00
at air time.

Frequencies in the 450-470 MHz range are usually paired in the
following way:

o channels between 450-455 MHz are paired with channels 5 MHz
higher (455-460 MHz).

o channels between 460-465 MHz are paired with channels 5 MHz
higher (465-470 MHz).

To save on space, only one half of the frequency pair is listed.
So, if a station is listed on 461.300 MHz, try listening on
466.300 MHz also.

The following is a copy of a frequency list sold at the NASCAR race
this past week in New Hamshire (I think that is where it was; my sister
and brother-in-law attended and borrowed my scanner.)

I have no idea of the validity of the list for the race since I wasn't there
and suspect most of the frequencies will change by the next race. But,
here goes anyways.

Winston Cup Series

Well, in none of these frequencies are in use when you need them, there
are clearly two places to use your search feature:

1) 460-470
2) 850-856

This should uncover just about anything you are looking for.

I have to agree with the excessive false alarms on the Laser band. This one seems to be more heat related. Last summer, I had a lot more of these than this winter.

My cell phone also triggers false alarms on the K bands when it crosses into a new cell, especially when it goes into roaming area. I called Bel about the problems. They said it was caused by EMI and sent a new cord to filter the power. Didn't seem to make any difference. I've learned to live with it.

Maybe somebody in this group can answer a question from way back in time.
In 1970, I remember a band opening between Oklahoma and New Zealand;
or, at least, that is my best guess as to where the signals originated.

The frequencies were in the 41 to 42Mhz range. Due to receiver
limitations, I could never tell whether the transmitters I was hearing were
using AM or FM, but I think they were AM. They appeared to be repeaters
operated by a New Zealand police agency which might be similar to our Highway
Patrols or state police as the content of the messages seemed to be more
about road accidents and disabled vehicles rather than metropolitan police
calls. One of the base station names I remember was "Auckland Transport."

Does or did New Zealand have such a network? Even during good band
openings, I have never heard those signals since about 1970 or 1971.
Just curious.

Cross-posted to: alt.2600,rec.radio.scanner,alt.radio.scanner

Cordless units with only a few channels are usually crystal controlled. Look for one transmit and one receive crystal per channel. You may be able to replace the crystals but they are likely to be cut for odd frequencies. Have you checked with AT&T for a solution?

2686. control channel technical info

Newsgroup: rec.radio.scanner

Does anyone know the specifics of trunked radio control channel transmissions? I have looked at them on a scope and they don't make much sense. I have a programmable DSP modem that I have used successfully to read a lot of different forms of modulation and data protocals but I had good information to start with. Any information would be appreciated.

Bruce.

Actually, all of those states exempt hams from the applicable law(s).
Only one of those states (Michigan I believe) specifies that to have
the ham exemption you must be a technician class or higher (therefore
a ham with a novice license is excluded from the exemption).

2689. PRO-51 Mods Suggestion

Newsgroup: rec.radio.scanner
Date: 1995-03-02 23:43:06 UTC
From: westj@ten-nash.ten.k12.tn.us
Message-ID: <3j5l6a$mmc@newssvr.cacd.rockwell.com>
Source record: 260776
Body handling: HTML body converted to readable text

I have been looking over the PRO-51 manual, and have been thinking evil thoughts. First, I know that all band and tuning information comes from the CPU, which drives the PLL and various diode switches to tune a given frequency. Now the CPU has been programmed at the factory with certain bands locked out . What I want to do is
reprogram the cpu to put the Cell band and the cordless phone freqs into the already programed Weather and Air bands.

Can this be done? I am sure the processor is available over the counter (if the electonics cops have not made that illegal also). Can one come up with new code for this chip? What would I need to buy/borrow to do it (minus soldering equipment I already own)?

Anyone have any suggestions, or has anyone already done this sort of brain opperation on their scanner?

Thanks, James

>>
>>When listening in on cellular frequencies what would be the reason that I
[...]

We all know that the Congress has told us that listening to cellular is illegal. So this guy says "while listening in on cellular frequencies" and we all accept that it's OK. There are some people who would say "Hey! he shouldn't do that!" Or what if he said "While I was going to work this morning, I came up on this guy in the left lane who was only going 75, and I had to slow down..." OK, and what if he said "I plugged this guy who I know for a fact was robbing liquor stores in the 'hood", or maybe even "My kid spit on me when I told him he had to do his homework, so I beat him with a hot fireplace poker."

Where do you draw the line on which laws are OK to ignore and which are not? Basically, the guy said "while I was breaking the law the other day,..."

Are scanner listeners law-abiding? The answer is probably "no." Now that cellular, as well as 46/49 phones, are illegal to monitor, you can read about yourself here in Sec. 2521 of the ECPA (Injunction against illegal interception):

Whenever it shall appear that any person is engaged or is about to engage in any act which constitutes or will constitute a felony violation of this chapter, the Attorney General may initiate a civil action in a district court of the United States to enjoin such violation. The court
[...]

So if you even "appear" to be engaging in an act of monitoring the cellular band, you're a not-yet-convicted felon. And when you answer a posting that asks for help to monitor 870 MHz communications, you are aiding/abetting a felonious act. You don't have to do it; you merely have to "appear" to be doing it.

What could you have possibly been thinking when you voted these people into office?

>'s up with that?
>
>- Randy Reyes

That would be the mod that you are looking for for your Pro-51. There
are NO simple internal modifications that you can do to this scanner.
Scan up and down from that test frequency to determine the range. 12A3
is merely the date code.

you should be able to receive the amateur bands
6 and 2 meters plus 70 and 33 centimeters.
6 meter = (50 to 54 MHz)
2 meters = (144 to 148 MHz)
70 centimeters = 420 to 450 MHz)
33 centimeters = (902 to 928 MHz)

The 2 meter band is the most active in my area
you may get different results in your area.

Happy Listening!

Robert Barker (robert@eden.com) wrote:
: Are their any scanners out there that can track 800 Mhz trunked systems?

Not yet, but I am sure it will come. There is no standard for trunking systems yet so it makes it a bit hard to build a scanner to do the job. Unless there are a very large number of frequencies, you can really do it with a turbo speed scanner. I do it with the BC-8500 for Orange County, CA Fire which has 3 groups of 5 freqs. One roaming freq per group is always the data channel and must be locked out each day (no BIG deal).

The problem comes when they put the entire city or county on the same group of, let's say 20 channels and have PD, Fire and everything else together..

I am pretty sure it was in this newsgroup that someone recently posted information on a (2-step?) process for getting CD-rom software for use with GPS equipment. It was something like - buy a software mappping program, send it in with some money, get a much better program, interface this with your GPS unit and, if you're using a laptop or other portable computer, real-time moving map.

Of course, I didn't save the post at the time.

If the author or anyone else with the details will please re-post, I would greatly appreciate it!

Thanks!

You can get the 888MHz test freq in chan 23 with the 11a4 pro-51 using
the above procedure. This does not seem to be the case with the 10a4
however. This info concluded from extensive testing at RS.

2713. AR8000 AUDIO SCAN - Solved!!

Newsgroup: rec.radio.scanner
Date: 1995-03-03 19:36:13 UTC
From: mike@shien.ist.csuohio.edu
Message-ID: <1995Mar3.193613.11600@news.csuohio.edu>
Source record: 260803

This info might help fellow AR8000 owners who suspect that their AUDIO SCAN/SEARCH function may not be working properly, when it in fact might be working just fine.

I recently posted my experiences with this, and was pretty convinced that there was a problem with the AUDIO SCAN/SEARCH not working on my radio too. I believe there really ARE units that are truly defective, but here is what I discovered about mine to solve the problem.

Hold down [FUNC] [4] at the same time, while turning the unit on, holding down these two keys until the radio displays "SET LEVEL" and "AUDIO LEVEL". There will be a 2-digit value displayed also (how to do this is also in the manual near the end).

It took me a while of fiddling with the radio and examining the manual to figure out that mine was set by default to 00 (rather than 0A like it says in the manual)! This parameter sets the minimum amount of modulation present in a carrier before it is considered a truly valid signal (and thus not bypassed via AUDIO SCAN/SEARCH). Thus when set to 00, AUDIO SCAN/SEARCH considers a perfectly quiet carrier to be a valid signal, thus opening the squelch and staying locked on that frequency, and all you hear is a dead carrier. It was precisely this that lead me to believe that my AR8000 was defective (until I found the solution).

Well, the manual says this default is "0A". With my default being 00, it effectively negated the effect of the AUDIO SCAN/SEARCH. So, I set the value to 0A (like the manual said) and it seemed to work fine. Actually, after some playing with it, I settled on a much lower value of 02, since 0A seemed to blow past signals with moderately strong carrier modulation; signals that you really DO want to hear. Setting it to 02 seemed to be enough for it to truly ignore reasonably quiet carriers.

The numbering scheme chosen for this parameter seems strange, and is in hexadecimal form, and ranges from 00 to 4F. Converted to decimal, this results in 80 discrete settings for the AUDIO LEVEL (4 * 16 + 16 = 80), F = 16 hex. You really don't need to know hex to set this, but it would have made more sense if it was sequentially indexed using conventional decimal notation (00 to 80). Of all the settings in this scanner, it's the only one that counts in hexadecimal. I guess this truly makes it a computer!

If setting AUDIO LEVEL to something greater than 00 does not fix it on your radio, then you probably have a bona fide problem with

it. My serial number by the way is 11412.

I hope this helps. It was a big relief.

Nicad batteries do not last as long as "convtional", i.e. alkaline, batteries. This is because their cell volage is a bit lower than alkalines. Yes, the batteries that are rapid charged will not last as long as when they are trickle chaed, mainly because of the heating When the nicads are heated, they vent through small holes in the top, thus losing electrolyte. This will kill the batteries if they lose enough.

Interested in a cheap and simple keyer circuit for a beacon ?
Based on the Microchip PIC16C54RC 18 pin microcontroller. Total cost
should be less than $8. Great for Ham Radio or "lowfer" beacons.
User configurable CW speed. Can accomodate a very lengthy (or short)
message without the need to "fill" empty space as in some clocked EPROM
designs. Very little wiring required for the hardware.
I have made the file containing PIC source code and documentation
available to the public domain.

FTP to humnet.humberc.on.ca and download the file "BCN_KEYR.ZIP" in the
HAMRADIO directory.

I had recently inquired for advice on the purchase of a PRO-43 & information on frequencies. All has been received and taken to thought.

I particularly appreciated the advice on checking a local pawn shop. To my surprise I found a PRO-43 with a date code prior to 4A4. -$115 & very nice condition.

Would anyone be able to advise me with regard to soldering/desoldering circuit board components? How much wattage? What type of solder? . . . or any other information that might be helpful.

Thanks again for to all who have given me useful information.

2744. Re: AR8000 AUDIO SCAN problem?

Newsgroup: rec.radio.scanner
Date: 1995-03-05 01:30:53 UTC
From: wa1omm@aol.com
Message-ID: <3jb48d$9ha@newsbf02.news.aol.com>
Source record: 260640

The audio scan problem was only on early UK units and can best be described as the failure of the unit to stop reliably on ACTIVE channels when the audio scan is ON. To get the unit to stop reliably involved setting the audio scan variable down to its lowest setting, so low that it would not skip channels without audio. The fix to these early UK units involved replacing three SMD's on one of the circuit boards. It is a fairly straight-forward and simple procedure, provided you have good eyes and the tools to handle the SMDs which are the size of a grain of ground pepper.

You really need to adjust the audi scan setting to suit your requirements. The default is almost never just right. And, if you are keying up a CB rig next to the 8000, there will likely be enough hum or audio pickup with such a strong signal to cause the 8000 to stop on that channel and monitor it.

YES, you can go to http://ftp.cdrom.com and look in the hamradio(or ham-something) they have quite a list of mods. there are a couple of pro-37 mods, but I have yet to try them, they're pretty old (feb 94) so I'm sure they work.

If you live in San Diego I highly reccommend the book "Scan Fan" which
can be obtained at HRO. This frequency (and lots of others) is in there.

The freq. is 464.8750, which I have personally confirmed. If you happen
to find any other info on them, I would appreciate you sharing...

You might also try the Radio Sport BBS at 279-3921.

Happy Scanning,

Doug

From the Consolidated Frequency List in the back of Police Call:

50-54 6 Meter ham band
54-72 Television, wide band FM (ch.s 2-4)
72-76 Land mobile, and low-power industrial
76-88 TV again (ch.s 5 and 6)

Hope this helps. Check out Police Call for more info...

Happy Scanning,

Doug

As well as some freqs allocated for paging, point-to-point links,
business 2-way radio, etc. 75.0MHz is used for runway NAVAIDS at airports.

Also, the entire 51-87.975MHz spectrum is part of the military's
VHF low-band allocation.

I am looking for "how to" modify the pro-2036 or specifically
Model 20-412 to receive cellular frequencies.

This may be a new model from Radio Shack

My scanner operations manual indicates 2 models of this scanner.

2) 20-412 (Canadian version less cellular frequencies)
3) 20-9412 (Europe/Australian including cellular frequencies)
The manufacturers label attached to my scanner shows
Pro-2036 Model 20-412

Please EMail

Thanks

2754. Idea for Pro 62 800 MHz Mod

Newsgroup: rec.radio.scanner
Date: 1995-03-05 05:54:02 UTC
From: jpbrody@u.washington.edu
Message-ID: <3jbjlq$vu9@nntp2.u.washington.edu>
Source record: 260752

Okay, I went out and bought a Pro-62 a couple of weeks ago, and then ordered the service manual from Tandy National Parts (817) 870-5600. This is a really nicely done 56 page manual with schematics, block diagrams, debugging info, and everything else you might want to know.

First off, if you are looking for a simple modification to get back the entire 800 MHz band in a nice way, you are probably out of luck. It looks like the CPU, GRE-9329, is hard coded to reject certain parts of 800 MHz, and there's really no way around that short of replacing the CPU.

On the other hand, I think I can see a kluge around the problem. The Pro-62 has three different voltage controlled oscillators (VCO's) and it looks like it uses VCO2 to tune the 800-960 MHz band and VCO1 to tune the 380-512 MHz band. So, the way the CPU blocks 825-850 Mhz is by returning an error and refusing to put out the correct voltage to VCO2. The kluge is to swap the signal from the CPU to VCO1 with VCO2. That way when the CPU thinks it is tuning 400 MHz it will really be tuning 826 MHz.

Of course, you also need to swap the signals to the band pass filters, but that's no problem.

I haven't tried this yet, and can't guarantee anything. I know a fair bit of electronics, but I've never really worked on RF circuits before now. There's still somethings about this circuit that I don't really understand. However, unless someone gives me a good reason why this won't work, I'll probably try it in the next few days and report back.

If anyone wants to try it, here's the simple explanation. Open up the back and look for the seven wire connector on the top circuit board. Cut wires 6 & 7 and swap them. (6 is blue and 7 is violet, cut them both and then reconnect the blue one from the connector on top to the violet one that goes underneath the circuit boards and vice versa.) Do the same for 4 & 5.

I'm thinking I'll just mount a switch on the back so that I can switch between normal mode and stealth 800 MHz mode.

If anyone else is working on the Pro-62 please email me. Also, I haven't seen the schematics, but the same trick might work on other triple conversion scanners, Pro-43, Pro-2035, and Pro-2037.

I noticed that a few people responded on "what those frequencies are for,"
but noone took a stab at why they are missing from many scanners.

So, I'll take a stab at it. My guess is that 51-88 MHz is filtered out early
in the RF stage of your scanner to prevent spurious signals from popping up
elsewhere. That range 51-88 MHz carries some TV channels, which in many areas
are powerful and cover a wide band. In other words, if they didn't filter it
out in your scanner, you'd have trouble hearing a lot of other things.

2758. Indoor Antenna?

Newsgroup: rec.radio.scanner
Date: 1995-03-05 11:33:11 UTC
From: Vaughan.Huska@odxabbs.tor250.org
Message-ID: <f7a_9503060040@tor250.org>
Source record: 260708

Hi, ya.

I know your question was to do with an indoor antenna known as
the "Eliminator", but just to show you a similar product under a
different name called, "Power Antenna", which also purports to turn
"your entire house into a giant, dynamic antenna" by simply plugging it
into a wall outlet may not be what they are cracked up to be.

According to Consumer Reports magazine (May 1994 issue, P. 363),
the "Power Antenna" was tested by a Consumer Reports' engineer who lives
in a New York City suburb. The engineer reported that on most channels,
the device couldn't even compete with his set's rabbit ears. He also
pointed out that it's not marked with the UL safety certification
carried by almost any well-designed plug-in device. For now, he said,
he'd hold on to his ugly roof antenna.

As to the claim that the "Power Antenna" makes weak stations
crystal clear, Consumer Reports' engineer labeled it, in his best
engineer's techn-speak, "a joke".

Not sure how your "Eliminator" fares. But, hey. It's yuor
money :)

Good luck.

2760. URL change for AR8000 Homepage, Win95 Preparation

Newsgroup: rec.radio.scanner
Date: 1995-03-05 13:51:03 UTC
From: vhealey@crl.com
Message-ID: <3jcf5g$o0u@nntp.crl.com>
Source record: 260743
Cross-posted to: rec.radio.scanner,alt.radio.scanner,crl.forsale

CRL.COM has apparently switched to a FTP server like Netcom's.
Though the old URL still works the new one should be

ftp://ftp.crl.com/users/vh/vhealey/www/ar8000.homepage.html

Please bear with crl.com as a service provider as they make this
switch to handle their rapid growth.
I guess they are concerned about their security for obvious reasons.
Can you say Mitnick?

The old URL appears to still work correctly but I would not rely on it.

BTW there may be a delay before additional posts are made to ar8000
information collection as I am having some problems adding new technology
to my PC. I am switching to EIDE drives. I just realized my old
(six months) Promise 4030vlb2 ide disk caching card dosn't allow me to do LBA
and so I was forced to buy the new Promise EIDE 2300 Plus. OS2 Warp got trashed
in the process (it be a major headache anyway so no big loss). I may lose
some more files but I believe I won't. The sticky point is that I have
an existing eide drive that I am keeping and when I switch to LBA I am not sure
if I can still read this one without reformating it outright to LBA.
I want to add WIN NT 3.5 WORKSTATION and WIN/95(March Release) to the system as well as
restore
a small partition with warp for testing purposes.

Links on homepage point to how to get win/95 in March 1995 for $30 if
you want to test it for Microsoft. If program is like NT final test
you get the final release either for free or discounted for taking part
in test.

I have the following for sale local to metro atlanta ga if anyone wants to call me
to make a deal by calling me at 435-6939

Promise 4030 vlb 2 card $40 (no ram included at that price)
Pro 43 handheld radio scanner $210 (some cosmetic scratchs)
IDE Disk drives
kalock 105MB $36
segate 130MB $46
Maxtor 225MB $79 (still under warrenty) 13 ms drive
Maxtor 340MB $119 (still under warrenty) 12 ms drive
WD Cavier 420MB $147 (two or more years left on warrenty)(10-11 ms drive)
WD Cavier 540MB $189 (two or more years left on warrenty)(10-11 ms drive)

A package deal of Promise with 4 meg of 70ns ram and both Cavier's for $450!
The PROMISE card supports 4 ide drives. Great for a BBS or local server.

From: dfleming@earth.execpc.com
Message-ID: <3jck26$n5g@homer.alpha.net>
Source record: 260761

Vic warned me about using a large antenna on the ar8000. Now my BNC connector is loose. I am scared to death to "pry" this thing open. Any advise about the "operation" from you scanner "MD's" would be appreciated. I can just see all those little parts falling on the floor when I open it up. You guessed it...I'm not anxious to do this but I'm not shipping the unit back to Javiation either.
The larger antenna's just exert too much leverage on the BNC and loosens it up somewhat. I don't think a 650 dollar scanner should come loose anywhere...but I still enjoy playing with the unit..
And my wife still has not a clue what I paid for the thing. I can't keep secrets very long so if you don't hear from me for a while it's because I decided to exonerate my consience and tell her. (I wonder how the unit will work from my room at the hospital?)......;)

2762. DTMF Tones?

Has anyone used a Diamond, Comet, or Anli amateur radio antenna for scanning? How did it work?

Right on! If monitoring were outlawed, only outlaws would monitor. Then people would be even moe vulnerable because they would think that they new couldn't be monitored.

From: robbino@primenet.com
Message-ID: <robbino.14.00139756@primenet.com>
Source record: 260654

After recently purchasing a shiny slightly used PRO-43 for a mere sum of $115 (local pawn shop - "as is") and feeling rather smug I began to enjoy. All was well. I was feeling real cool. Frequencies were flourishing. I was pressing buttons till my fingers went numb. Me thinks this could be fun!

However, to my surprise my little gem suddenly failed. Aghh! The display suddenly stopped dead, then vanished. - $115. I'm no longer feeling smug.

I bought new batteries - still nothing.

My consolation is this - If I turn the unit on and press the "light" button I can see the light on the display (A $115 nightlight for my kids)? Still no digital readout of any sort.

When I initially turn this beauty on (after off 2-3 minutes) I hear a brief faint "click" (I would call it an electromagnetic sound) from the speaker - then nothing. If I turn it off and on rapidly with no wait, there is no "click."

My spirit is dashed. My scanner is dead. Any suggestions (be nice, guys)? Any ideas of what the problem could be (be nice again)?

Does anyone have a suggestion where I could bring my scanner for repairs? I live in Minneapolis, Minnesota.

If I bring it to the Tandy Service center (no mods) would they replace the circuitry that makes mods possible?

I would sincerely appreciate any Techno-Nerdo's help:*)

Desperate,

e-mail robbino@primenet.com

: Received an interesting catalog the other day wherein a Uniden Bearcat
: was advetised. It is a 100 channel "Turboscan" that scans 100 channels
: per second. "Has data skip and memory backupthat retains frequencies for
: up to 3 days without batteries. Has rechargeable nicad battery pack, AC
: adapter." Unfortunately there is no model number listed. Anyone
: familiar with the above described scanner and/or has any advice about the
: quality of Bearcat handhelds please reply as I am looking for one.

From the things you listed it sounds like it is a Uniden Sportcat
Scanner. The model number is SC150Y/B (I'm in Canada so it might be
different for you).29MHz to 956MHz, 100 channel memory, Twin turbo scan
up to 100ch./sec. preprogrammed band search, uniqu data skip. That last
bit made me think it was the same model, but I could be wrong. They cost
about $470CDN, but at a recent sale you could have picked one up with
taxes for $280US. Not bad... I would suggest you get a copy of a spec
comparison or review... I luckily got one form a kind user with great
information to help my decision between a Bearcat and a Pro-43

>CPU thinks it is tuning 400 MHz it will really be tuning 826 MHz.
>
>Of course, you also need to swap the signals to the band pass filters, but
>that's no problem.
>

I hope no one tried this, because it doesn't work. I thought the CPU
was sending a voltage to the VCO's to set the local oscillator, but it
is just throwing a switch to enable them. It looks like the frequency
is somehow pulse encoded by the CPU and sent to a PLL chip which
synthesizes the proper frequency. So, it looks like no full 800 MHz
band without replacing the CPU.

I often scan frequencies at which I hear people entering touch tones. What I am looking for is a device that can display the touch tones on like a led display board. Like one of those figure 8's that display all numbers well thats not a good description but if you know what I'm talking about you'll get it.

So bottom line could someone e-mail me the skematics of a touch tone decoder that auidibly takes in the tones from the scanners speaker and displays the number.

Diagram:

```
---------------------------
| 8 8 8- 8 8 8- 8 8 8 8 |
| * |
---------------------------
```

* could be a mic

Can anyone help me???????????

Please e-mail me!!!!!!!!!!!!!!!!!!!!!!!!!

Can anyone help me with a small query?

Is there any way I can use my PC to decode some of the data tranmissions that I hear on my scanner. Such as ACARS or other similiar things?

I am able to plug my scanner into the MIC socket on my SOUNDBLASTER card and I can use software to listen/record the scanner tranmissions. So is it possible to use some other type of software in the same sort of way but to decode data.

Any ideas?

Many Thanks
matthew@adelaide.DIALix.oz.au

>What are the Marine Radio Channels? Or where should I look for them?
>
>How bout' the Marine Operator channels?

There are actually two marine bands. The most common is in the VHF band. There are also another group of frequencies in the low range (2 MHz and above off the top of my head) that are referred to as Single SideBand (SSB) frequencies since that is the transmission mode.

Any good scanner book should have these frequencies listed. In the Consolidated Frequency List in the back of Police Call you can find the VHF freq.s in the 150 MHz neighbourhood, with the marine operator in the 160's. The channels to listen to are:

16 Calling and distress
21a CG communications with other crafts
28(?) Marine operator (varies by area)

and whatever other channels are active in your area. The best thing to do is scan the entire band for a few weeks, then program the channels that are most interesting to you.

And no, I will not post the frequencies (although I have no objection to someone else doing so). One of the things that helped me learn about this sport is doing things myself...

Good Luck,

Doug

That's the Winegard SM-2200 scanner antenna and I use one with
a 24-hour a day scanner/baby monitor repeater setup.
My SM-2200 was a $5 hamfest special in a sealed box.

It is an old design, advertised to cover VHF-low, VHF-high,
and UHF bands.

The SM-2200 is supplied with 65 ft of coax cable fitted with a
Motorola plug. A balun is included so the antenna is at DC ground,
posing less lightning hazard than a discone.

The last address I have for Winegard is:

Winegard Co.
3000 Kirkwood St.
Burlington, Iowa USA

The freq's you want are all listed in the ScanFan book for southern Cal.
Available at Walden's or SuperCrown book stores. Both are in the Pt.
Loma area of San Diego, just down the street from the America's Cup. I
have them all programmed in my PRO-43, but there are quite a few and
you'd be better off buying the book. Too many to list here. It lists
for $18.95 and is a solid inch thick! Good Luck! Enjoy.

Source record: 260625

el124@cleveland.Freenet.Edu (Mike Wilson) asked:
> Hmmm...What exactly is the result of using a cell phone in the air?

It's a violation of the FAA regs (FAR 91.21); of the FCC rules; of the airlines rules; and of your cellular carrier's contract. At the least you will have the flight crew tell you to power it off immediately. At worst: you will lose cellular service, be sued by your cellular provider, be sued by the provider you were flying over, be fined by the FAA, and be fined by the FCC (OK, these are unlikely but possible).

Cellular systems assume low power and short range, so the same frequencies can be used at multiple sites within a system. At cruising altitude you would be picked up at several different locations, interfering with a number of different conversations.

Cellular determines which site you are closest to by relative signal strength. At altitude the central computer would 'see' you all over town and get a little sick trying to transfer you from site to site. Since your cellular phone periodicly signals the system to confirm location, this happens even if you don't actually place a call.

The power output of your cellular phone is enough to cause problems with the aircraft's navigation systems (NASA's safety reporting magazine has reported a number of such incidents).

In short - DON'T DO IT !!

I believe that's a reference to the study in the Dec '94 Consumer Reports.
The test was actually of the "Buddy-L" device used to recharge conventional
alkaline cells. It confirmed that the device was essentially useless.

The evaluation of Rayovac's "Renewal" batteries, while not supporting all
of the manufacturer's claims, was generally positive.

2796. 2500 Cell Restoration

Newsgroup: rec.radio.scanner
Date: 1995-03-06 12:19:00 UTC
From: chris.fortner@softnet.com
Message-ID: <5.2999.895.0N5D3B1E@softnet.com>
Source record: 260491

For whoever was looking for it, here is a message I grabbed a few months back on restoring the 800MHz band of the Bearcat 2500XLT. I have done this mod on my 2500 with success, so enjoy!

Modifying the Uniden BearCat BC2500XLT

1993 Howard Bornstein and Russell Keating

This set of instructions describes the procedures to modify the BC2500XLT handheld scanner to pick up the deleted "business" range of frequencies. After performing this modification, the BC2500XLT will have continuous coverage from 760 to 1300 MHz. In addition, when searching in the "business" bands, the scanner will step in the appropriate 30 KHz steps.

You should have a low-wattage soldering iron with a fine tip, a small, slotted screwdriver, a maginfing glass, and a bright light. It also helps to have steady hands!

TAKING THE CASE APART
First, remove the antenna and battery pack. Remove the two black screws on the back of the scanner. These are on either side of the belt clip. Also remove the two silver screws at the bottom, "under" the battery pack. Put these parts in a safe place.

The case is held together by friction tabs. They are tight along the sides, right at the top of the battery compartment. Try using a small slotted screwdriver and slide it down the sides of the scanner in the groove. With a little (very little) force, you should able to snap open the case. Try not to damage the plastic.

Lay the scanner down on its face (on a soft surface) and carefully pull the back plastic cover off. The back cover comes off about 3/4 of an inch below the top of the scanner. The piece of plastic the molds over the top back of the scanner (the piece that has the speaker and headphone jacks stays on.)

REMOVING THE CIRCUIT BOARDS
You'll see three circuit boards stacked on top of each other. The top two are held together by silver brackets on either side of the boards. Take your slotted screwdriver and slide it under the edge of one of the silver side bracket at the

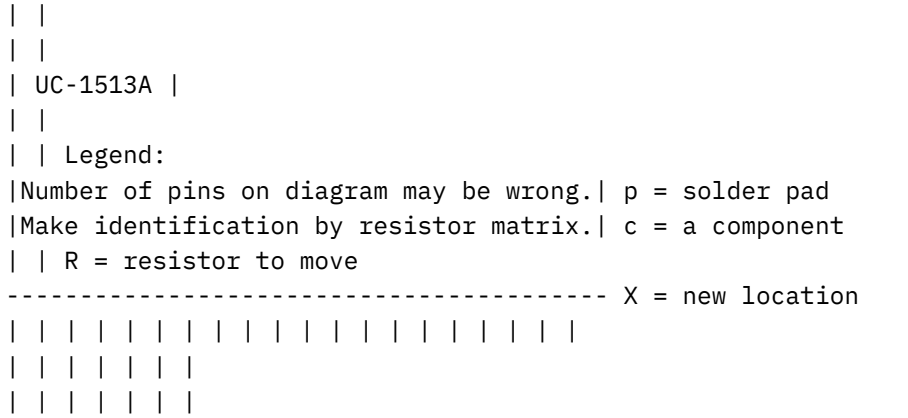
bottom. Then use the screwdriver to pry up gently. This will lift the double-board and lift the pins out of the black, 11-pin molex connector that is part of the bottom (third) board.

Lift the double-board circuit board "sandwhich" by the brackets and completely disconnet the molex connector. Now, the plastic part of the case on the top will separate from the front of the scanner. It may stick a little because there are friction tabs on either side of the volume/squelch knob. Apply a downward pressure to the top of the scanner (at the knobs) if it is sticking. Lift the entire sandwhich up. It is connected by a ribbon cable to the bottom board. Be careful not to stretch the ribbon connector as you lay the board along side the radio.

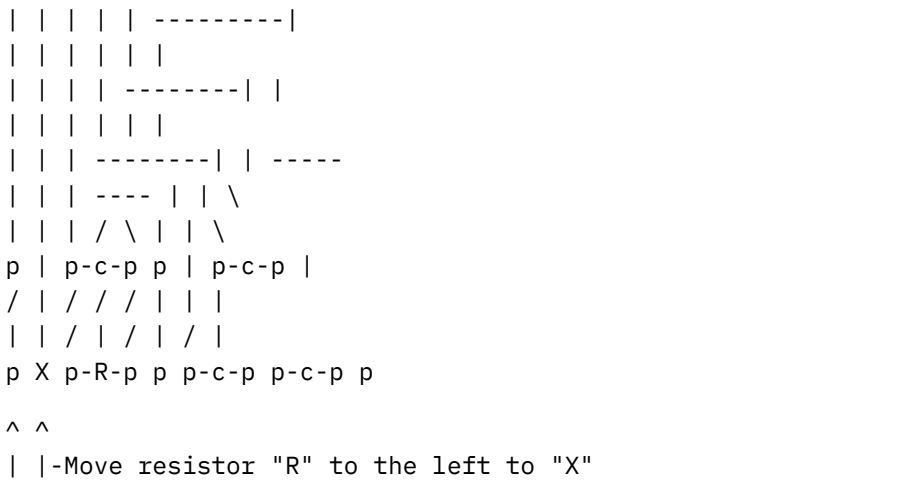
PERFORMING THE MOD
You now need to locate the microprocessor chip. It's the biggest IC chip on the bottom board. It is labeled "Uniden UC-1513A." With the scanner in a normal "antenna-to-the-top" orientation, you'll find a group of surface-mounted resistor chips below the microprocessor. These chips are TINY! About the size of a large grain of pepper. However, if you look at them with a magnifier, you'll see that they're labeled "104."

There are two rows of SM resistors. The top row has two chips and the botton row has three (see the diagram below).

To perform the actual modification, you need to unsolder the left-most chip in the bottom row (labeled "R" in the diagram). To unsolder the chip, place your small-tipped soldering iron against the left or right edge of the chip and apply a slight pressure. The combination of heat and pressure will unsolder the chip and slide it off it's pad. You will want to move it with your tweezers to the open pad to its immediate left (labeled "X" in the diagram) and solder it back in place. The hardest part will probably be placing the resisitor on the new pads and keeping it there while you resolder it.



UC-1513A
Legend:
Number of pins on diagram may be wrong.
Make identification by resistor matrix.
p = solder pad
c = a component
R = resistor to move
X = new location



```
| | | | | ---------|
| | | | | |
| | | | --------| |
| | | | | |
| | | --------| | -----
| | | ---- | | \
| | | / \ | | \
p | p-c-p p | p-c-p |
/ | / / / | | |
| | / | / | / |
p X p-R-p p p-c-p p-c-p p

^ ^
| |-Move resistor "R" to the left to "X"
```

REASSEMBLING AND TESTING
Next, reassemble the scanner. Start by placing the molex pins in the connector and then put the circuit boarrd unit back in place.

Close up the case.

You can test the mod by entering 869.000 MHz and then pressing the LMT key. Then enter 894.000 and press LMT again. Finally press the SRC key. The scanner should start searching, however, there is a good chance it will be searching in improper steps. To make it search in the correct 30 KHz steps, press the decimal key TWICE. This sets the increment to 30 KHz. However, nothing appears in the display for the step increment, since the BC2500XLT doesn't use this increment for any other range.

Note, however, that there is a birdie at 870.39 MHz. In addition, the BC2500XLT may lock up on other frequencies in the "business" range and lock up on the digital contral channels. To get a continuous search, you may have to constrain the range to be less than the full "business" base range.

Watching this thing search through "business" at 100 cps is awesome!

Good luck and have fun!

Thanks to Bob Grove for the first description of this mod and to Russell Keating for the ASCII diagram!

After making do with a handheld for a number of years, I'm finally going to make the move to a desk model.

My question is: Any thoughts or feelings on the Pro-2006 vs. the Pro-2035. I recently got the latest catalog from Grove and am torn between the 2. Any feelings on whether it's better to get the 2006 in it's cell restorable form or whether the Pro-2035 with the GRE converter would work just as well?

Many thanks for any and all input before I go and lay out the coin.

Recommend you read the article in January 1995 Monitoring Times
comparing the PRO-2006 to the PRO-2035.

The PRO-2006 RF performance is better than the PRO-2035.

You didn't say if you wanted to connect the scanner to a computer.
If so, you may want to stay with the PRO-2006 and fit it with
an aftermarket interface.

In any event, I recommend the new Uniden/Bearcat BC9000XLT.
It's a "2035-killer."

From: convict@pipeline.com
Message-ID: <3jf2tp$905@pipe2.pipeline.com>
Source record: 260634

I've heard that there is a device that will allow a person to listen to frequencies that inverted. Of course I'm refering to the 900mhz cordless phones. I've seen peoples saying that they got said hardware device. My question is:

#1. If I have a scanner(AOR 2515) that recieves the inverted signals,

Just how does this device hook up to my scanner to clear the signal?
I know that every channel has a high and low (upper/lower) and remember how SSB works. Do these devices require me to open up my scanner and look for anything? Or does it hook up on through the Anttena's BNC connector?

If you've bought such a device or have held one and used it could you elabrate on the instructions.

You may respond in the group if you like or personally e-me.
Thanks....

David Blake

I am planning to build a small portable rack to hold both a scanner and a CB. I want to be able to easily move them from one car to the other, and secure them when not in use. I don't want to have two antennas and I can't forsee using both at the same time.

My question is, should I get a scanner antenna or a CB antenna? Will either give reasonable performance on both radios? I am most interested in scanning the 150/160 range.

Hoi All,

Sometime ago someone gave me one of the first computerscanner available in The Netherlands the Scooper Jupiter. To program this scanner you need a codebook because the frequenties have to be entered in a pattern of 0's and 1's (10 switches). The frequentierange is 76-87 MHz and 156.3-168.2 MHz.

What I'm looking for is this codebook and the user's manual. Is there anyone outhere who can help me to this books (or photocopies). If not mabye there's someone who knows the address of the Scoopermanifacturer.

I use a Diamond RH77CA on my scanner as well as my dual-band HT. The
Diamond has an advantage below ~150 MHz, but little difference between
it and the stock antenna above that.

A) 2/3 w/Hi-cap nicads, and NiMh, IMMEDIATELY after a complete full charge, they
lose approx. 3-5% per day, Nicads lose 1% per day.

B) I can and will, among others, I've been designing battery backup systems
for 12 years now and deal extensively with the major battery manufacturers
and engineering staff.

^^

Basic chemistry of storage cells should have taught you other than what
was stated.

I have been looking at replacing an NiMh battery backup system with Renewal
type technology since our findings here on my project have shown Renewals
to be more 'robust' and dependable for shelf life of storage cells and
current capacity. What we have found is that the 3-5 hours charge time for
AA's is not accurate, but 8 - 12 hours more appropriate to return the cell
to full capacity.

Rechargeable Alkaline technology is not new, Rayovac licensed the process
from a Canadian company. With some minor improvements (increased current
capacity) I think they'll blow the conventional alkaline market away,
but the tradeoff for now is reduced capacity for safe recharging without
buildup of pressure.

Try them, they're pretty surprising and me and those involved on my staff
here won't use anything but rechargeable alkalines for presonal use hereon.

Remington makes an AA recharger that seems to be more effective. It pulse
charges with a substantial amount of current and is very effective, but
I found that it doesn't do a good job of tapering off the current with
weak batteries (or batteries that have been charge a dozen times or so)
and they get quite hot. I haven't had any alkalines blow yet but this
charger is acutally very effective.

I am currently facing a dilema. I might need to upgrade to a better 800MHz portable scanner (currently own a Realistic PRO-43). I need good reception on the VHF low bands even with the duck antennas which I do get on the Bearcats that I currntly have but cannot even come close to getting low band on the PRO-43 with the duck antenna. I am cuurently looking at the PRO-62, PRO-51 and the BC 220. Considering the fact that I need good low band reception with the duck antenna which should I get? I find that the sensitivity readings of .5 mv or lower are much better for low band reception (I don't know the specs on the 220's sensitivity but the PRO-51 and 62 are 1.0mv which is terrible). Please help and thanks in advance.

: : Minnesota allows you to have scanners in your car if your a ham too.

: Actually, all of those states exempt hams from the applicable law(s).
: Only one of those states (Michigan I believe) specifies that to have
: the ham exemption you must be a technician class or higher (therefore
: a ham with a novice license is excluded from the exemption).

Not a problem - the present No-code license *is* the technician license (as I understand it) as it permits two meter voice which a novice never had. I think the two are technician and technician plus (meaning with code) and no more "novice class".

The Universal M-400 and m-8000 will decode ACARS. The M-400 sells for
$400 and the 8000 for around $1300. Take a look through Monitoring Times
for a picture of the M-400 and a listing of the modes it decodes.

>David Blake

Do you mean inverted as in inversion scrambling? or conversion as in
converting a 900 mhz signal down to say uhf or vhf.

I assume since you mention SSB, you are referring to Audio Inversion
Scrambling.

If So, Basically you are on the right track.

Inversion scrambling simply runs the pre-modulator audio through a balanced
mixer stage (like SSB) with typically a 1500Hz audio carrier injection. And
like SSB this produces double sideband out. This is then sent to the modulator
stage of the transmitter. It winds up sounding very much like SSB over the
air.
The inverse of this is simply injecting a carrier at some stage in the
RCVR to produce a 1500Hz beat note with the DEMODULATED scrambled audio.
These converters usually are tunable (similar to a clarifier control in SSB)
to produce natural sounding audio.

The hard part with the cordless phones are that they may use a different
audio carrier than 1500hz. It may not even be a sine wave.

Good Hunting :)

:

Not too bad actually, if you use a random length wire
running the length of an attic (about 60 feet), with a BNC
connector. The supplied antenna blows, but I did actually catch
WWV at 10MHz on the second floor of my house, with
the supplied rubber carrot, although the reception
was pretty static-filled.

2819. BEL 645STiP radar detector

Newsgroup: rec.radio.scanner
Date: 1995-03-06 20:04:59 UTC
From: Kimberly.Sanborn@dartmouth.edu
Message-ID: <3jfptb$qic@dartvax.dartmouth.edu>
Source record: 260713

I've seen some talk about the BEL radar detector. I was going to purchase one, then, with the help of a handi-dandi chart in an electronic magazine, I came to the conclusion that I could purchase a Uniden with the same features and save almost $100. So, instead of buying 1 BEL, I bought 2 Unidens.

If you insist on buying BEL, I suggest you check out the ads in the back of electronic magazines. I purchased my UNIDENs out of NY after doing some major price shoppings. I think the cheapest BEL 645STiP I found was for $225.

My two cents worth.
-Kimberly

2820. 900 MHz fone questions

Newsgroup: rec.radio.scanner
Date: 1995-03-06 20:06:19 UTC
From: ZUSCHLAG@LMSC.LOCKHEED.COM
Message-ID: <17359AA3BS86.L694047@LMSC5.IS.LMSC.LOCKHEED.COM>
Source record: 260712

The local Radio Shack distributor sells 2 different models of 900 MHz cordless telephones. One says "Escort" on the bottom of the handset, is advertized in the catalog as "secure ... spread spectrum", and looks very much like the Escort phone with the same features advertised. The other is "just" a digital phone, single frequency (says the dealer) that still offers digital sound quality and increased range versus the 46/49 phones. Anyone used either of these? Your opinions? Recommendations?

Thanks.

Fred

>I notice that the 51-88 MHz frequencies are not available on my scanner.
>Could someone with some smarts tell me why

A previous poster mentioned filtering out that range to avoide spurious signal reception. That is true, but the biggest reason for not including that range is echonomics. In this part of the world, there isn't all that much to hear with the kind of narrow-band AM and FM detectors found in most scanners. The 52-54Mhz and 72-76Mhz ranges are the only ones in which one might find narrow-band FM signals and the lower-part of the 6-meter ham band is about the only part of 51-88Mhz where one might find a use for a narrow-band AM detector.

Don't get me wrong. There is a lot of neat stuff to be heard in that range, but designers of scanners who are trying to make a little money don't want to put much work in to that range of frequencies because it would be of limited value to most people.

I believe that in Europe and many other parts of the world, scanners often-times don't come with a 30-50Mhz band for the same reason. Instead, they come with a range of frequencies that includes the 60-80 or so megahertz range because that's where the action is, there.

Some telephone circuits have echo suppressors on them to silence the
side tone because it arrives a fraction of a second late. This is common
to circuits that use satellites as part of their path or which go
through some other long path.

For satellite circuits, this creates an echo of about 1/3 second.
Most humans are reduced to stammering when their own voice comes back to them
with that much delay. Shorter delays which one might find in a path of a few
hundred miles don't produce a reverb-like echo, but might just sound weird
to the person who is speaking. For that reason, telephone systems have
suppressed the side tone echo for years. Some of these suppressors are
digital and very sophisticated. Others are crude devices which mute the
return audio while the person is talking. If two people are talking at once
or there is a lot of background noise, this type of echo suppressor will
block out the person on the other end of the line or chop out portions of what
he or she is saying. Some circuits may have echo suppression on when it is
not needed as it would be better to have it all the time than not to have it
at all.

I am not a telephone engineer, and I don't even play one on TV,
but I have followed discussions of echo suppression on long-distance circuits
and those are the reasons given most often for suppressing the side tone.

I own a Pro-51 also. My only complaint about it, since it does
not use triple conversion, it gets a lot of images. The nice
thing about the images, is that one can hear a good deal of the
celluar frequencies on 894-915Mhz if someone (not me...) wishes to
do so.

I am one of the people who thinks that the communications act of 1934 made good sense. I am also one of those people whose behavior hasn't changed one bit just because a bunch of lobbiest paid a bunch of lawyers to spread ink on paper and burden our legal system with more proscriptions even though we can't keep up with the real crimes that actually do harm our way of life.

It seems that all the ECPA did was to raise the price of pre-lobotomised scanners and create a knowledge base for those who want to restore banned coverage segments. I wonder how it ultimately will effect sales of scanners when there is no longer any easy way to restore full coverage? After all, part of the excitement of scanning has always been being able to hear anything that is out there.

I built one years ago from an article in Radio Electronics magazine. I have also seen them at ham swaps. It basically plugs into the speaker jack. The signal is converted and played through speaker that is built into the conversion unit. When you switch the power to the unit off, the regular audio passes right through to the speaker in the unit.

Hi,

I'm currently working on a North American guide to Fire Fepartment frequencies.

I'm looking for any and all Fire Dept. Freqs.

The info I need for each is as follows:

1) FD Name
2) City/Town
3) State/Province
4) Freqs.
4a) CTCSS if used and/or known
4b) Type of traffic, ie. Dispatch, Operations, EMS, etc.

I'm planning to hopefilly put this list on a www page in the near future
and am hoping I can collect as many freqs as possible.

Also I would be interested in overseas FD freqs. if you know them.

Please e-mail me directly as I don't want to take up everybody's valuable
bandwidth on this project.

I can be reached at jeffkriss@maloca.com

Thanx in advance,

Jeff

I received an AR8000 as a late Christmas present. It was neat playing
with it but now it's just sitting in the box. I really don't have time
to scan. It is a waste to just leave it sitting there, I know it
is a very expensive scanner.

It is about two months old and is in mint condition. No scratches anywhere.
It is the totally unblocked model. Make me an offer. If I receive an
offer to my liking I will sell it.

By the way it is serial No. 014547

Thanks
Vic

I heard that Optronics has a 2035 computer interface in the works.
I got a 2006 myself. Works fine, and the 2006 is supposed to be
better immune to RF interference, some images, and the like,
than the 2035. The only disadvantages are a 400 channel memory,
vs a 1000 channel memory, although each has 10 banks. Ten
one-hundred channel banks, I think, are as much use as ten forty
channel banks, anyway. Also, the 2035 scans at 50 cps, as opposed
to 26 cps (without the computer interface) on a 2006. Other than
that, my 2006 more than suits my purposes.

2847. BC3000XLT

Newsgroup: rec.radio.scanner
Date: 1995-03-07 02:04:23 UTC
From: "Matt Cage Hester, kd6kzq" <jmh1045@ucs.usl.edu>
Message-ID: <3jgev7$8j6@rouge.usl.edu>
Source record: 260588
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Could I get some info from some BC 3000XLT owners?

How do you like it? What is the price range? Was it a good buy?

I'm mainly looking at it because it has Wide and Narrow FM, as I
listen to a lot of STL's and need the wide.

Any other suggestions in the same appr. $ range would be appreciated.

I presently have a PRO-2006 base, and a PRO-62 handheld. The 62 had
no mode selection. With the exception of no FM band and the mode
selection, it is a fine little scanner with the triple conversion
feature.

Thanks in advance

Matt,

For sale or trade: MFJ-1270B TNC2, best offer or will trade for a scanner. Would like a portable scanner, but if you have a base type let me know anyway. Thanks for reading.

The MFJ-1270B is in like new condition and was wired to my Icom IC-229H at home. I have all that came with it, including boxes, manuals etc. It didn't come with software, but worked perfectly with any communications program I used. It's suppose to work with HF, but I never tried it. I just don't use it anymore and it's just collecting dust. So take it from me with your best offer or trade. I will also consider a OCR scanner....

George

Would like a Pro43 if possible for trade...
Please e-mail to gpabon@aol.com

2857. Re: Idea for Pro 62 800 MHz Mod

Newsgroup: rec.radio.scanner
Date: 1995-03-07 09:45:21 UTC
From: none@nowhere
Message-ID: <none-0703950145210001@fig-ppp.caltech.edu>
Source record: 260688

[Following up on Jim Brody's two posts (see end if you need a rehash).]

I posted an pair of ideas like yours about three weeks ago (i might be able to find a copy, but dont have much time right now) and feel that it 'should' have worked for you. Anyway, I know little about the pro-62, but can point out what i noticed on the bc-200/bc-100/pro-35.

(Note, however, there are much easier ways to do a cell on a 200 ... these were intended to hopefully expand other bands (a little)).

On these models, there are the signal lines for each 'section' (UHF/AIR/VHFHI/VHFLO ...), plus a clocked input to the PLL (a NPC PLL2002A1 -- BTW: does anyone know which company makes this chip????). The PLL output feeds *in parallel* to the four different tuning segments. Some of these segments then use multipliers to get things to the right range. So, switching the 'UHF' and '800' enabling lines 'should' work.

Two things to watch out for: make sure the signals are of the same 'sign'. On the BC-200, as coming off of the chip (ie, before the inverters Q203/204) 800 and UHF are negated w.r.t. AIR, VHI and VLO. Secondly, make sure the bands are compatable; ie: it might not be wise to switch VHI with 800 (or your equivalent) since VHI may be encoded (in memory/cpu) as AIR+VHI, and so you would get 'AM' mode for part of 800 band. (on the 200, AIR and VHI are almost the same -- they go though a diode pair to form a single signal into the 'AIR/VHI' tuning segment.)

Other thoughts:
On the 200 the AIR/VHI/VLO all use the 'AGC' circuit (pin 1 of IC3 = LA1186N), yet neither UHF nor 800 do ==> probably only be wise to switch UHF & 800.

On the 200, UHF & 800 both enable the 'Window Unit' (IC301). I havent figured out this unit yet. However, if you have something similar, then it adds additional reasons to only switch UHF and 800.

If you do not have it, get the PRO-62 service manual from RS. Typically these run < $10 and are quite good. The block diagram and such may be quite valuable, but there's a section that might give you ideas that isn't obvious: the alignment/adjustment section

The PLL subsection really has two outputs to the tuning segments, one off of the 'VCO buffer' (Q701) and one off of the 'DC Buffer Amp' (IC702) which is refered to as the 'Tune Line'. If you look at the VCO accuracy figures (for the Tune Line), typically +/- .5V over a 1- ~13V range) it seems extremely hard to believe that voltage accurately controls tuning, at lest on this line

If all else fails, here was the other idea i posted: it seems that most
of the scanner micros check for freq.s upon _entry_. If you could write
the right values to the RAM/EEPROM then it *probably* will not check them,
and go blindly using them (just like test mode freq.s).

I'm not a EE, so take everything with that in mind, but hope these helps...

>range (2 MHz and above off the top of my head) that are referred to
>as Single SideBand (SSB) frequencies since that is the transmission
>mode.
>
>Any good scanner book should have these frequencies listed.

OOPS! I forgot to mention that it is the VHF freq.s that almost any
scanner book will have. Since very few scanners have the capability
to pick up the SSB freq.s, they are not usually listed. They are available
from various sources, the easiest would be a shop that specializes in
marine electronics. You can also find them in the FCC regulations, but
I don't have the section numbers handy. E-mail me if you're interested.

There are a lot of freq.s in this area, but a good knowledge of HF
propagation is needed to know what to listen to when. These bands
are interspersed with the Shortwave bands, so if you already have
that type of equipment and knowledge, marine ssb shouldn't give you
any trouble.

The VHF bands on the other hand generally require no new equipment,
are local, and are busier. All of these factors add up to more interesting
listening IMO.

Happy Scanning,

Doug

I'm interested in headphones for my scanner that are sounproofed and amplifiied so that I can hear at the races. My BC205XLT does not have a very loud sound output. I've heard that the ouput can be modified, but if I go to the races i would want to split to two headphones for two users. I thought if I coud find soundproofed headphones with a built-in amplifier (maybe with a 9-volt power supply) and of course a volume control knob would be great.

Does anyone have suggestions where to get it?

That might help, but typically the unloaded speaker output from any radio is still too much for a microphone input on a recorder. The speaker amp is trying to drive an 8 ohm load, and the mike input is either in the 600 or multi 100k-ohm range.

Radio Shack used to sell attenuator patch cords which will allow you to properly pad the speaker output from your scanner to your tape recorder's mike input. I don't know if they still do, but this is a fairly common need, so I would think that they would still carry this attenuating patch cord.

Conversely, if you have parts and like to tinker, I've made a patch cord of my own. The patch cord consists of a 10 ohm resistor across the speaker output of the scanner to provide a load for the speaker amp in the scanner, then a DC blocking capacitor of about 0.1 uF between the hot lead from the scanner's speaker output to the tape recorder mike's input. I used shielded audio cable throughout to minimize AC hum pickup, since the mike-side of the patch cord is at a fairly high impedance. My experimenting seems to indicate that the key is the 10 ohm load resistor. Once that's in place, the speaker amp is less likely to overload the mike input.

2867. Re: Grove Bandstacking Convertor

Newsgroup: rec.radio.scanner
Date: 1995-03-07 16:38:25 UTC
From: rats@ihlpm.ihsam.att.com
Message-ID: <D52ww1.AnM@nntpa.cb.att.com>
Source record: 260715

Basically, this utilises a relatively low frequency Local Oscillator
in which the harmonics are used to feed into the mixer; each harmonic
will downconvert some portion of the 200-400Mhz down to the Aircraft
band so as to enable AM demodulation. Hence the term "Bandstacking"
in which each relevant harmonic will downconvert a band of frequencies
to exactly the same Aircraft band frequencies. By tuning the full
bandwidth of the VHF airband with this downconvertor, you are actually
tuning many different bands of frequencies on UHF simultaneously. There
is little chance of simultaneous reception on different frequencies
due to the fact that these military frequencies are pretty sparsely
populated... really, pretty clever a solution to military band
reception...

I know that you cannot enter a frequency which is not divisible by its step size, with the exception of the Step Offset feature which lets you enter a frequency that is precisely one-half step off of a frequency that is divisible by that step increment.
Using postings on the referenced subject, I am trying to find a way to enter search parameters with a starting freq of 1419.9 and a step size of 30 KHz (in violation of the above-stated principle).
The only fall back position I have divined is to simply set the step at 10KHz and tolerate slower searches which sometimes lock in to the lower, weaker frequency. Any ideas will be appreciated. Thanks!

It's amazing what you can hear in a 12 hour period if you tape everything.
I get about 1 hour of taped mil-air comms in a 24 hour period, and lots
of neat action from a 3 state-wide area.

Uniden (I believe) used to make a 100 channel 10 bank alpha numeric scanner. I can not find it anywhere nor do I know the name of it.

I am looking for a flat scanner with alpha numeric readouts that will also search freq limits. I am mounting it in a fire dept command car and do not have a lot of room. Better to be flat than deep. It will mount on a goose neck type arm to swivel around.

Anybody have any suggestions?

: Why can only one voice of a cell call be picked up, but other times both
: sides are heard? This happens on 800mhz and also 1200mhz.

Often, the cell company blocks the mobile audio from being repeated. This serves two purposes, first it prevents scanner people from fully monitoring both sides of the conversation...you only hear the audio from the caller on the "land line" side. The other reason is to prevent feedback from the mobile when using hands free operation. In this case the mic in the mobile would be picking up the audio from the speaker and sending it back to the base station. If the base side of the cell repeated this audio, it would be fed back to the mobile and would cause "howling". The reason some sites still have both sides of the conversation is probably 'cause the cell carrier hasnt fully converted all their equipment....

I assume this is solely for recording weather channel broadcasts, right?

I use a simple phono patch cord (mono or stereo), plug one end into the scanner earphone jack and one into the microphone jack of my portable stereo. Works great. Couple of things to remember, though. The volume of the scanner should be way down. Adjust volume via the recording equipment. Also, if using a stereo like mine, tune down the treble and bass, so that you don't get some nasty distortion. You're working with a limited audio frequency range and you don't need to boost frequencies outside the human vocal range.

I've learned that using a patch cord to a mini-recorder (at least the cheapo VOC Sanyo I have) DOESN'T work well. Static. It would've been an good setup, since it would have been totally portable. Somehow, I don't see myself lugging my "boom box" with a scanner connected to it. Kinda retro 80's if you ask me. :)

Some high end scanners can be hooked up to a computer, which will allow you to control the scanner from the PC. And if you are running it from a computer, you of course need software. The nice thing about software is that some allows you to record "hits" when scanning a certain band, and give you great flexibility in scanning. Like if you wanted to search up and down several bands (usually a scanner itself will only let you scan continuously between two values), and can save the frequencies where it found any transmissions.

I have been using my new BC9000 for a few days now, alongside my Pro2006. I like it a lot and have put the Pro 2006 up for sale. The scan speed is very good to excellent. I haven't experienced any significant inter-mod or adjacent channel splatter. The alpha labels are a nice help and can be applied to any of the 500 channels, with a limit of a total number of labels to 250. Selective attenuation can be applied to any channel if needed.

Being able to designate any specific channels you desire to be taped is *VERY* handy and works quite well. In the 360 MHz to 385 MHz range, cellular calls come in loud and clear, so stay away from those freqs when searching!

Delay can be set for any desired channel(s). The display is *Bright* and clear and gives info such as search increment, bank number, chan number, etc.

In short, so far it seems very nice to me. I have ordered the CTSS tone decoder... it will make a great scanner even better, in my opinion.

Yeah, I used the scanner flying from Salt Lake to Orange County last Spring. The airline was Delta. Although I had no problem getting a scanner through security point, I did not show off the radio inside the plane. Just scan the 118-136 range and don't forget the headphone, preferrably stereo (with the mono-stereo convertor of course!!)

The safest thing to do is to (1) have charged batteries in place and (2) have the radio programmed to come up on a non-controversial frequency such as weather radio. The guards may want to turn the set on to make sure it works, so they'll know that it isn't loaded with something other than batteries and circuitry.

The same rule applies to laptop computers; I heard of an incident a while back where a fellow was detained briefly after guards watched him start up his 386 laptop -- seems that he had Unix installed on it rather than DOS, and the guards were under orders to make sure that the computer booted to the DOS prompt! Dunno what those noodnicks will do when Windows 95 ships (or when someone shows up with OS/2 on his notebook)...

I would suggest sending your scanner to Racing Electronics in New Jersey. I think their phone # is 1-800-272-7111. They can do a simple audio modification for about $15 that will make the audio about 10 times louder. They also sell several different types of headphones that are built specifically for using at the races. The headphone prices range from $29 to over $300. I have the $29 pair and they work just fine. They cut out about 90% of the engine noise, are pretty light, and have seperate voulume control knobs for each ear.

The Unidens are cheaper, but, they aren't that great. For one, the
falsing is out of control. I had (LRD4000W)one for 2 weeks and sent it
back. It
picked up "Ka" all of the time. Interesting since there are no Ka units
in Oregon. It also falses on K. It switched between X and K a lot.The
laser is supposed to be OK. It went off twice for no reason but it did save me
once. I still have my old Passport of 5 years and think it's the best
(if you don't have to worry about laser and Ka). I really like the new
Passport with the mini Spectrum analyzer but haven't bought one yet. I
took the money from the Uniden and put it toward a new ARC Interceptor
Active jammer. The only thing that will defeat instant on.

I've never had trouble traveling through airport security with either scanners or two-way radios in my carry-ons. If you DO run into trouble, offer to disconnect the battery from the radio. There was a time when that was required anyway. But make sure you don't short out the battery terminals inside your carry-on and the baggage catches fire!!!

By the way, Delta Airlines do allow the use of scanners in-flight, according to information that has been sent to me. That is, of course, if you are willing to fly on Delta.....

2897. Faster Crystals = Faster Scan Rates?

Newsgroup: rec.radio.scanner
Date: 1995-03-08 02:56:22 UTC
From: pkhmah@aol.com
Message-ID: <3jj6cm$apd@newsbf02.news.aol.com>
Source record: 260583

I replaced the 2MHz xtal in my PRO-34 with a 4MHz xtal, in an attempt to increase the scan rate. However the scan rate remained unchanged (8-10 channels/sec). I tried a 10MHz xtal, and the scan rate still remained unchanged. I measured the scan rate by scanning a single bank of 20 programmed channels (unprogrammed channels scan much faster, and do not give a measure of the actual scan rate). After installing the 10MHz xtal I noticed that the scanner seemed to scan just fine (although at its same slow speed), but would not lock onto a channel (could not tune my own cordless phone freq. on it)!

Yes, I did change the microprocessor xtal and not a xtal on the RF board! In fact the micoprocessor crystal is the only xtal on the logic board!

Anyway, does anyone have any idea why this is occurring? I would expect that a crystal that was too fast for the microprocessor would simply cause it to not function, or lock up!

I would appreciate any comment or suggestions here. I am truly puzzled!

Please email to pkh@mtc.aro.allied.com

Thanks,

Paul

I thought it was a function of the cellular carrier and their equipment.
In Canada (or Alberta anyway) the Non-wireline carrier (Cantel) supresses
the mobile side of the conversation on all calls (although occasionally
there is a bit of leakage).

Hi.

I have just brought a Bearcat 200XLT scanner, and when I went to do the MOD, I found the Microprocessor was labeled UC-1147A, Not the UC-1147 mentioned in the MOD I had.. And the diode you are supposed to cut didnt even exist. I presume a different model is sold in New Zealand where I live, to that sold in USA where the MOD came from. I was hoping someone had a solution.. I think they are the same scanners sold in Australia.

Thanks... I hope.

This might be in the wrong group but there seems to be some knowledgable people on this subject here. I recall a recent thread about only 1/2 of cell phone conversations coming through when scanning and someone said that certain phones only transmit one side of the conversation. Well my question is what brands and/or models do this. Thanks

2903. Bearcat 9000XLT

Newsgroup: rec.radio.scanner

From: dmaxwell@hookup.net
Message-ID: <dmaxwell.27.2F5D4B60@hookup.net>
Source record: 260593

Re the bearcat 9000 xlt.I have purchased a unit and done my own comparison tests.I live 150miles east of detroit in ontario canada,I like to listen to the detroit pd on uhf.in my shack i have an icom r7000 as well as other radios. on the weekend i hooked up both units side by side,on identical discone antennas with identical preamps.The result in my opinion was that the 9000 performed every bit as good as the 7000.The only advantage i felt with the 7000 was the signal meter.The tone on the 9000 is improved with an external and as anyone with a 7000 knows the bearcat certainly put it to shame when it comes to the scan mode.I would certainly recommend buying this unit to anyone.I further recommend buying it from scanner world in albany Ny.I got great service from them.

Note:These are my own opinions and im not getting kickbacks from uniden

>but can point out what i noticed on the bc-200/bc-100/pro-35.

Okay, I looked at the schematic and think it should have worked for me
too. Not for the original reason I tried it, but because like you said
the PLL feeds the VCO's in parallel. I may have given up too quick, I
mean I did the modification, checked out where I thought I should get the
830 MHz signal didn't see anything, and then figured out that I didn't
know what was going on. Well, some things haven't changed much. I still
don't really know how this radio works.

Anyway, maybe I'll give it another try when I get some time.

>If all else fails, here was the other idea i posted: it seems that most
>of the scanner micros check for freq.s upon _entry_. If you could write
>the right values to the RAM/EEPROM then it *probably* will not check them,
>and go blindly using them (just like test mode freq.s).

That would be kind of hard to do, at least on the Pro-62, but it gave me
another idea. You could intercept the signal between the CPU and the PLL
and fiddle with the bits. This would probably be pretty easy, just some
digital logic on a board. Of course, you'd really have to know what the
CPU and the PLL are doing. So, anyone have the data sheet for GRE-9329
and M64074G?

>either give reasonable performance on both radios? I am most interested
>in scanning the 150/160 range.
>Pete Gifford

You should get a CB antenna. The reason is that the scanner antenna might or might not be a good match for your CB transmitter. If it's not, you'll blow out the radio. The scanner will only be receiving, so it's much less critical what you hook up to it. ANY antenna will work ok. The CB antenna will give you a little gain at 27 MHz and probably at multiples of 27 MHz, too. I assume you will be swapping the coax manually when you switch radios. Don't try to rig up some way of having them both connected at once - the CB will cook the scanner when you transmit.

Uniden MR-8100. Many mixed reviews on this one. I owned one and loved it. The alpha is something you will love. The letters are big and easy to see (good idea in a mobile environment). It is rumored to be prone to intermod, but I never experienced this. They are becoming harder and harder to find as they have been out of production for a number of years. I sold mine a few years ago and bought some more sophisticated gear. Try some of the scanner related BBSs. They usually have a "for sale" section and you might find one there.

GOOD LUCK!!!

>so they'll know that it isn't loaded with something other than batteries and
>circuitry.

I've had more trouble with the *antennas* than the radios.........

At one airport, I was carrying my scanner, HT, and a couple of
rubber-duck antennas in my briefcase. After going through the X-ray
machine, I got the "Can I look in your briefcase?". I figured it was
the radio with the battery pack, since this shows up as a dark lump
next to a bunch of circuits. The guard said he wasn't as interested
in that as he was the antennas, which showed up sort of like a spring,
since they were helically wound. Once he saw they actually were
antennas with radios to go with them, he let me through with no
trouble. Didn't even have to demo the radios for him.

I've also had those "Film Shield" bags X-rayed and nobody has ever had
me open them. Seems kind of odd, since they show up as a *big* black
lump and give no hint as to content.

>the power coming out of the earphone jack? Thanks.

Several of the responses I've seen thus far mention various ways of
connecting the scanner to the microphone input of the recorder.

But the level of the scanner output is MUCH higher than what microphone-
level input expects....that's why several posters have noted that the
output level of the scanner should be turned WAY down.

If your recorder has a "line in" connection, that's the best way to
make the connection....and you won't have to worry about overloading
the recorder and creating tons of distortion.

If the recorder does not have a line-level input, then you're stuck
with using the mic input...and [as one followup noted] Radio Shack
in the U.S. sells a connector cable which will reduce the level enough
to avoid overloading the microphone input.

Hope this helps. Good listening!

2923. AM Broadcast on scanner?

Newsgroup: rec.radio.scanner
Date: 1995-03-08 21:30:10 UTC
From: gregjo@wordperfect.com
Message-ID: <gregjo-0803951430100001@pcgjohnson.orem.novell.com>
Source record: 260623

I'm a dangerously radio-challenged person with a simple question:
How come I can pick up standard AM broadcasts with a transistor
radio, yet can't hear a thing with my scanner? (example 1160 Khz).
I can pick up some shortwave stations by chucking a long wire out
my window, but nothing in the standard AM band. What does the
transistor radio have that my scanner doesn't? (I can get standard FM
broadcasts as well as TV audio).
Thanks.

Before I lost my programmed channels in my scanner I had a freq.
of the board operator on KFI 640 am. What I would hear was the board
operator talking to people, presumably on the other side of a glass
barrier. If no one was talking, the broadcast of the station could be heard.
What was interesting is that this broadcast seemed to be the undelayed and
uncensored pre-broadcast signal. Now I have lost it and can't find it.
KFI is in Los Angeles. Does anyone have this freq?

: channels/sec). I tried a 10MHz xtal, and the scan rate still remained
: unchanged. I measured the scan rate by scanning a single bank of 20
: programmed channels (unprogrammed channels scan much faster, and do not
: give a measure of the actual scan rate). After installing the 10MHz xtal
: I noticed that the scanner seemed to scan just fine (although at its same
: slow speed), but would not lock onto a channel (could not tune my own
: cordless phone freq. on it)!

: Yes, I did change the microprocessor xtal and not a xtal on the RF board!
: In fact the micoprocessor crystal is the only xtal on the logic board!

: Anyway, does anyone have any idea why this is occurring? I would expect
: that a crystal that was too fast for the microprocessor would simply cause
: it to not function, or lock up!

: I would appreciate any comment or suggestions here. I am truly puzzled!

: Please email to pkh@mtc.aro.allied.com

: Thanks,

: Paul

They probably have some hardware timer they use for the scan period
instead of a simple software loop. Keep digging- you may find
a resettable timer (possibly a simple R/C circuit with a reset).
Put the microprocessor crystal back the way it was and tweak
the timer.

Consider too The Frequency Fan Club out of GA.
Their number is 1-800-RACE-FAN.
I attend 6 to 7 Indy Car and NASCAR races a year and these folks have
serviced me well through the years with scanners, spliters, headphones, etc.
They also attend most of the major races and will broadcast all the driver's
frequencies prior to the start of the race so you can monitor them.

2931. Test Mode or Mods for PRO-34

Newsgroup: rec.radio.scanner

Hello all,
Because previous questions of mine were answered so well here, I hope you don't mind if I ask a few here.

1. Will a conversion kit work on a Bearcat BC350A? It only has 406-512Mhz. I'd like to get 800Mhz on it. (I'm sure I'll be advised to get a new scanner, but I'm only looking at this as a temporary solution)

2. These 2 frequencies are baffling me - 464.8375 and 491.5375 - because they have what sound like phone conversations on them. I only know of the 46/49 and 900Mhz cordless, and the 800Mhz cellular phones. Are there any "new" frequencies I don't know about?

3. Is there a difference between a scanner with "Total Coverage" and one with "Continuous Coverage" ?

4. When I finally decide to upgrade scanners, what features should be VITAL in my decision? Any recommendations?

I know this is alot to ask, but I figure I'll get it out of the way in one shot.

Thanks in advance for any help...
James

Right off hand, yes. There is a company that sells two versions of a Log-periodic antenna. One version is 25-2000 MHz, the other 136-2000 MHz (I think). An aquaintance of mine has had both, and they work great! Priced around $250. Check the Ham rags- I believe the company name is Create Products.

8000 "EX" Fnc. Problems!

RE: "EX" Command for the AR-8000 interface won't work for me!

I can not get the "EX" command to work. Example - While using different commands via [Computer ::Interface:: AR-8000] (all of which work great) I can not get the "EX" command to function, the AR-8000 beeps like it excepted the command but I can not use the keypad as the Manual explains, until I manually push [LOCAL] on the 8000 key pad.

Can someone try your "EX" command and tell me if yours works!?

Thanks.............Ben

> Thanks.

So Greg, you're kidding us ...right ??

The simple answer is that 1160 kHz is = 1.16 MHz and your scanner probably
isn't able to receive that frequency. Few are. Your AM transistor radio
is specifically designed to receive those frequencies between 530 kHz to
~1800 kHz,
i.e. .53 MHz to 1.8 MHz.

Your scanner is OK, Greg. Keep up the hobby, it's a great one.
Happy Scanning and Good Luck with the airwaves.

After scanning the traffic on this newsgroup it's clear that most people have mobile scanners, why ? Most seem to scan the same stuff I do police EMS etc... I understand some people carry their units with them to races and events. Does a mobil unit have a advantage over a base that I don't know about ?

I have a model 2030 RS base, it seems like a good scanner for the price 150.00. I don't ever here the 2030 mentioned here :-(

Scan on !!

The manual that came with mine is a skimpy 10 pages from ACE Communications. If you have questions, I'll be happy to type in the answer from the manual (within reason - 1/2 a page or so...)

Try asking about this on something like sci.electronics.repair. You'll
probably be told it's an electrolytic capacitor in the power supply
section gone bad. Or even something as simple as a fuse on the circuit
board.

```
REALISTIC PRO-34 200 CHANNEL SCANNER FOR SALE
Less than 4 years old. Never dropped or otherwise abused.
This scanner is in great condition. Asking $175.00
Call Don at (307) 721-8959 or
e-mail at dlarson@uwyo.edu
Includes original packaging and owner's manual,
and covers the following frequencies:
30-54 MHz
108-174 MHz
380-512 MHz
806.0000-823.9375 MHz
851.1125-868.9375 MHz
896.1125-960.0000 MHz
I understand that this unit is modifiable for complete 800 MHz coverage
and also 66-88 MHz, although I have not performed these mods.
Serial No. 979930 if it matters to you.
---Donald Larson---
---Laramie Wyoming---

It varies from race to race. If you are going to the Atlanta or Darlington race, try monitoring 465.775

They do not begin to give out frequencies until 5 minutes prior to the start of the race.

They also usually have a trailer selling scanners and supplies where ever they set up suvinoir alley at the tracks.

Hope this helps.

I talked in depth to V tech (Tropez phones) today.

They have had a FEW calls on the clear monitoring of their scrambled phones
on 444.800.

They like me CAN NOT say this is true I found a carrier at that freq from
the phone.

But NO voice signal at all.There was nothing at all that you could tell
was a phone call, no voice,no dial tone , nothing .

tropez is very concerned about this and if ANYONE has this problem witha
Tropez phone they want to look at it.

Hello Anybody,
My Pro43's speaker has taken a dump. When I turn it on all I hear is NOTHING.
If I slap it around a little I can get some noise out of it but either
the speaker blew up, or a connection came lose or ???.
If I plug in an external speaker all is well! I have a service manual but
have not had time to open up the radio yet.
Now, my question, Has anyone had a like problem and how hard is the
speaker to replace? I did the "mods" about a year ago so I can find my
way around in there, and I am sure I did not screw anything up cuz it
worked fine (well with it's lousy audio) for a year.
By the way the Radio Shack amplified speakers (the ones that look like
Motorola boxes) are great.
Any thoughts you all may have would be welcome.
Thanks Dave

2985. Radio volume control busted

Newsgroup: rec.radio.scanner
Date: 1995-03-10 11:56:50 UTC
From: dpfg@ukc.ac.uk
Message-ID: <6746@rook.ukc.ac.uk>
Source record: 260552
Cross-posted to: rec.radio.scanner,sci.electronics.repair

I have a radio that is similar to but not the Steepletone model which is quite big and receives standard broadcasts plus a few air/marine bands.

For some time now, the volume control has been very dodgy. Occasionally I can set it nicely and then the radio works quite well, but if I try to adjust it the radio crackles and makes funny noises, including a lot of humming.

In AM mode especially, there is a noticeable click if I touch the (metallic) volume or tuning dial.

I tried taking the back off but there is nothing obviously wrong like a loose wire. Any suggestions as to what the problem may be, or if it would be economic to attempt to have it repaired (where?) given that it only cost about 40 quid in the first place?

Thanks.

2986. Pro-2004 vs PRO-2006

I have my aor8000 set to search the shortwave spectrum and have gotten decent reception using the radio shack center-weighted antenna. I havent tried it with the rubber duckie which I've stopped using completely because its doesn;t work well on *certain* frequencies. I also have an aor3000 which certainly is more powerful than the aor8000 but the portable gets all of the samer frequencies if not a strongly. i've been thinking about getting a little desktop antenna that i can use to switch back and forth between the 8000 and the 3000. Does anyone have any suggestions?

If you mean Howard Bornsteins "Guide to the AR1000" you can send him mail
direct via CompuServe (76174.637@Compuserve.com) or I think people like EEB,
Grove and Scanners UnLtd sell it.

Hi Everyone!
I am in need of a frequency and was told it IS in the Betty Bearcat
Frequency book but I do not have that anymore.
I am in need of the frequency for WNYT Channel 13 TV Station.
It is located in Albany,N.Y.
I kow the TV station can be heard on the scanner but I don't know where to look.
My TV went freaky on me and I really want to listen to that station
if I can't wantch it at the moment.
Any help would be appreciated.
Thanks!
John
P.S.I am unable to read this group,so please send e-mail with any info.

2996. pro-46 (date 5A4 & newer) mods???

Newsgroup: rec.radio.scanner
Date: 1995-03-10 16:49:28 UTC
From: gdruebsamen@vms4.sci.csupomona.edu
Message-ID: <1995Mar10.094928.1@clstcs>
Source record: 260428

Hello,

I have a pro-46 scanner with the date code 5A4, and it seems the older pro-46 mods of moving the two resistors labeled "000" do not work. There is a green wire coming out of the top right "unused" solder pad, and this wire goes into the display.

I know there exists a mod for the newer pro-46 (apparently Uniden added another circuit besides only the jumpers to disable 800mhz coverage). Does anyone have this mod, or know how to do it???

Any information would be very much apprecieated....

Thanks in Advance!!

: Desperate,

: e-mail robbino@primenet.com
I called the local RS to see what the policy was. What's
supposed to happen is that they'll replace whatever needs
to be replaced to fix it. If the CPU is okay and it's something
else, it should come back modifiable. If the CPU is damaged,
they'll replace it with a new CPU. I asked if that meant
a permanently blocked one and they didn't know.

So I guess it depends on what broke. Frankly, an independent
shop may not be able to do any better because if the CPU
is the culprit, they have to buy it from RS anyway. RS *did*
say that if you send in one that has had the band expansion
mods done, they'll leave the mods in place-- as long
as the mods aren't part of what broke the radio. Is that
the way it works in practice? Dunno. None of my RS scanners

have ever broken so I haven't tested the system yet.

2999. Monster truck remote kill frequencies???

Newsgroup: rec.radio.scanner
Date: 1995-03-10 18:24:54 UTC
From: mudaw@uxa.ecn.bgu.edu
Message-ID: <3jq5hm$av2@ecom4.ecn.bgu.edu>
Source record: 260431

At the last monster truck show I went to (also the first one),
They kept bragging about the radio remote engine kill switches.
The guy standing way over there had what appeared to be a walkie-talkie,
with a DTMF keypad on the front. I assume he just transmitted a few
tones, and the receiver in the truck told the computer to kill
the engine.
Anyone know any more about this?

3000. Re: Bearcat 9000XLT

Newsgroup: rec.radio.scanner
Date: 1995-03-10 18:30:57 UTC
From: dkiner@best.com
Message-ID: <3jq5t1$gkh@news1.best.com>
Source record: 260434

Regarding the BC-9000XLT:

I am considering purchasing this scanner, and perhaps someone that has purchased/evaluated one of them can answer the following
questions:

I read another post that the "alphunumeric" labeling of freqs can only be performed on 250 of the 500 memories? Is this true? If so, is it
limited to the FIRST 250 memories, or a grand total of 250, regardless of their position?

Also, what (if any) mods are out there for this radio?

Thanks in advance for any responses - Feel free to e-mail or post!

rsharp@paul.spu.edu (Ron) writes:
: I've only had my AR8000 for about one month, and already the scan and
: enter buttons pain has worn off (the lettering)!
:
: Suggestions?

I got the snug-fit case too, so wearing is a not a problem, however, before I got the case I used the keypad to enter about 370 frequencies, manually. The arrow keys were black, now are slightly gray (after wearing away a little). Several other keys seem slightly grayer now too, but, luckily still readable.

So, has anyone thought of any way of coating the keys with some sort of transparent stuff (clear acrylic, or similar) that will protect (seal) the paint for the keypad buttons and prevent them from wearing any further? Clear nail polish might work, but it is acetone based and might dissolve the ink on the buttons, and certainly etch the gray casing if you get some on it accidentally.

How 'bout the stuff artists spray on pastel or pencil drawings to "protect" them from smudging? I'd also think some transparent latex-based sealer would work, but don't know if there is such a product available. Clear liquid vinyl floor wax, perhaps?

All depends on if the white key rubber (silicone based, probably) will take to a sealant. Wonder if a thin coating of clear silicone seal (like for a bathtub), applied lightly with the finger to each keypad, will work.

Yep, AOR botched it on this one. Otherwise physically a fine radio.

Mike

Yeah, I got one. I haven't seen an AR8000 yet, so don't know if this will help. On my Casio watch, the white ink wore out, making it hard to read the letters and numbers on the buttons. My wife gave me a bottle of Fabric Writer ink in iridescent white mist. (Stop laughing!) I took a toothpick, and smeared it into the indentations on the buttons. A quick wipe with a paper towel to remove the excess, and eureka! I could read the buttons again. Worked great! The ink is thick, not runny lick (ah, that's like) regular ink.

Source record: 260570
Cross-posted to: rec.radio.scanner,alt.radio.scanner

The deficient speaker in the early production of the PRO-43 is a known problem. The replacement 500mw speaker can be ordered from Tandy Natl Parts, (800) 442-2425. Give them the catalog nbr of the scanner, 20-300, and ask for the SP-0228 speaker ($11.89).
To replace the speaker, follow the disassembly procedure for the cell mod (use the one that does not require unsoldering the antenna) and then remove the bottom board. You'll have to unsolder the speaker wires and unglue the speaker from the case. Just be careful of the LCD when reassembling.

>Most noisey volume controls can be given a new lease of life if
you can get a small amount of thin oil inside them. There is
usually a hole in the case of the control, or a gap where the
terminals come out. Try getting one or two drops of sewing machine
oil inside, and then rotate the knob from end to end a few times.
Be careful not to get any oil on the dial drive string if there is
one! I use a hyperdermic syringe for this job myself. There are
aerosol sprays available, but I find that oil works best.

I'm not sure where you are, but that's not really necessary.
I'd suggest that you find a local HAM club; many of these people are scanner buffs, too.
I gather that you have no way to determine which frequencies you get 'hits' on. This means that you can't simply program in the frequencies you have, and let the scanner go, recording hits. This is where other scanner buffs who are local to you will be able to help. Some of them WILl have that capability, and have already done that, and will be happy to share their lists with you.
Hope this helps.

Yes: they are mobile!
You can take it where ever you go (subject to certain limitations, of course). While shopping (watch the others around you as they try to determine if you are police or not!), while at the Fair, while driving (plugs into the Stereo via a casette tape adapter from RS), while BBQing, while visiting a friend (good way to get them interested), while at the dentist (works well with headphones), almost anywhere.

GJ> radio, yet can't hear a thing with my scanner? (example 1160 Khz).
GJ> I can pick up some shortwave stations by chucking a long wire out
GJ> my window, but nothing in the standard AM band. What does the
GJ> transistor radio have that my scanner doesn't? (I can get standard FM
GJ> broadcasts as well as TV audio).

This would be easier if I knew what scanner you have, but here goes...
Most scanners start their coverage at 30 MHz. Receiving anything below that can't be done (without a converter, or other expensive modifications). There are scanners (usually called something like 'full coverage') that will cover from, say, 100KHz to 1 GHz or so. If you have one of these, you should be able to receive standard AM broadcast stations just fine.
Since you say you can get standard FM BC stations, you obviously do not have a run-of-the-mill scanner. Maybe a PRO-2006? -5? -4?
In any case, there should be a label somewhere to tell what the frequency ranges of the scanner are. Check this, and see if the AM band is covered, If not, you can't get it.
Hope this helps.

SD> appreciated.

Well, I use a PRO 43, one of the earlier, modifiable ones. The biggest
difference between a 43 and the 200XLT is that the 43 is triple conversion,
while the 200XLT is double conversion. This means that the 43 will suffer
from much less in the way of images and intermod, especially in a
frequency-rich environment, like a city. Service is also less problematical.
The 43 doesn't need a specific battery pack; any set of AA batteries will
do.
For more info on specific models, keep asking... there are a lot of people
willing to answer.

SC> Is there a mod for the Pro 43 to enable the cb freqs on it, or should I
SC> just get a different scanner?

Steve, the CB freqs are below 30 MHz, which is where most scanners start,
including the PRO-43.
This sort of modification isn't possible.
It's cheaper to go to a pawn shop and buy an older CB radio than almost
anything else.
A Short Wave Receiver is another option. Make sure it's one that will cover
the CB band, and not a real El Cheapo unit that covers only SWBC and Ham.
Hope this helps.

>Does anybody know how good this radar detector is Cat no 22-1647. How
>good is a laser detector anyway. I'm told that once it picks up laser,
>Its too late.

This appears daily on "rec.auto.driving", but the answer is yes. Light does not bounce as far oof target as radar. Once your detector goes off, it is too late. Youre busted!!!

the good news is that police really dont like laser, they have to get out of their car. Aim this gun at passing cars, ect ... It is much easier to simply leave a radar gun on while you are in a car. So laser isnt used as ofetn as radar.

As far as radar detectors. If you live in an area where the police routinly nail commuters then get a valentine 1. It is simply the best radar detector out there. It has directional markers to tell you where the radar is coming from. you simply cant beat its range and quality.

The non laser model goes for ~$350 and the laser model (not really needed) goes for $400. Seems exspensive until you consider the average ticket is $250 not including insurance penalties. You can only get these units direct from valentine. Car and Driver has an ad for them every month.

I dont work for the compnay, just a person who has been saved more than once by my valentine 1 :-)

I think perhaps they were referring to image scanners? As there is a lot
of alt.binaries.pictures.whatever.. that most books refer to as Gigs of
copyright infringments. The IHAC and the CRTC does not have the mandate
to regulate Scanners, Ham Radio, CB or similar equipment. The CRTC's
mandate is strictly commercial broadcasting, telephone and cable service.

: Has anyone used a Diamond, Comet, or Anli amateur radio antenna for scanning? How did it work?

Why don't you save the money and just use a cheap 18" stinger. I use it with my BC-8500 in the Los Angeles area and it works great on all of the bands. Most of the new radios have switching circuits depending on what band they are receiving at the moment and they adjust to the antenna. I didn't believe it either, but the stinger, out of the wrapper works just fine.

I have a couple of questions about DTMF. First off, what are the extended keys used for? I can't think of any general use for them offhand. In addition the basic DTMF tones used on a telephone, I've come across other frequencies classed as DTMF (or rather tone signalling). There's two that are single frequency: 2600Hz and 3700Hz. Also, there six others used in DTMF as "supervisory signals": 700, 900, 1100, 1300, 1500, and 1700 (Hz). Are these signals used for radio/telephone or what?

Just curious as usual. :)

Well, the first thing that I'd try is to spray a little contact cleaner
on the volume potentiometer. If that doesn't work, and you're handy with
a soldering iron, you might want to run down to your local electronics
store and buy a replacement pot. Beyond that, I don't know.

G'luck!

Try squirting some switch cleaner into the volume control, turning it as you do. Be quite liberal with it.
You can get some from Maplin Electronic supplies. There dotted around the country. They sell spray cans of the stuff and each can comes with a nice long plastic tube to help reach those little awkward places. Just pop in and tell them the problem and they will get you the right one.

Regards,
Joe.

ekaras@chs.cusd.claremont.edu shaped the electrons to say:

ek> DOES ANYBODY HAVE THE FREQUENCIES FOR MOTOROLA RADIUS RADIOS. THANKS
ek> ALOT

I have a couple dozen [in my radio], but they're probably not the ones you
want.

See, the way radios work, they're programmed with the frequencies of the
service that purchased/leased/etc'd them. They don't just have a set batch of
frequencies.

My suggestion is wherever you are, find a Radio Shack in your area with a
local scanner book [the one I frequent here has the "Alberta Frequency
Guide", but that won't be of any use to you either]. I've also heard there is
a book called Police Call that is sold by them, which lists many US
frequencies, but being in Canada, the book is useless to me, plus Canadian
'Shacks don't carry it anyway.

Hope you got some help out of this disjointed message.. I just woke up. :)

Hi Neil, I wonder if you would be interested in trading the Pro-2006 scanner for my Tek 453 50MHz 2-ch delayed sweep oscilloscope? I assume the scanner is in good condition, as the 'scope works very well and I know you will be pleased with the value of this trade. I hope you will be interested: ron.black@railbbs.damar.com 206 335-4907 8a-8p Pacific.

cr> Pro-43 for Sale, modified for 800Mhz, no manual
cr> $ 175.00 shipping not included
cr> Lawrence, crscasio@pixi.com

I would like to trade a Tek 321A Oscilloscope for your scanner if
you would be interested. The 'scope is a 1-ch 6MHz true portable, with NiCad
or alkaline D-cell battery operation (not included), with external DC power
or 117vac line operation. You will like the high quality of this Tek 'scope.
I assume your scanner is in good operating condition...what battery and
external supply is included? Hope you are interested:

Here are a few JFK freqs for you to plug into your scanner......

Unicom 122.95 Departure control 135.9, 121.0, 123.7, 134.35, 124.75, 269.0
Tower 119.1, 123.9, 120.05, 125.25, 132.4, 135.9
Ground control 121.9, 121.65, 348.6
Clearance 135.03, 348.6
Gate hold 125.05
Helicopter 125.25

Dont forget 123.1 which is NYPD's aviation frequency.

This problem is more severe in some parts of Ottawa than others. I use
a RS Discone antenna on my scanners and only get the odd pager. But
if you use a hand-held even with the rubber antenna on the Queenway (417)
between Bronson and Nicholas St you will hear what most users dub Intermod
Alley. You will even get pagers bleeding through crystal controlled 2-Way
radios. Besides the problem will end in about 1 year when the new regional
Police move up to 800 mhz digital radios..

The simple fact is there are 100's of sites that don't offer all the usenet news groups. So I am sure some site only carry alt.radio.scanner I have seen some sites that don't have any rec. groups, some that don't have any alt. groups. The National Capital FreeNet has both. I checked the usenet lists with several of the commercial providers in town, the most popular one has about 1000 usenet groups vs. 5200 on FreeNet, but they have some alt. and rec. groups not offered by FreeNet and vice versa.

Are you sure that's the right way around? Rec is supposed to have the better
propogation, so use that one!

Anyway, in my experience of various news sites, they all carry alt and rec.
Several miss out alt.binaries.*, but I've never seen a system that doesn't
carry alt at all.

>Jeff
Hi Jeff,
I used an Alinco DJ580-T dual-band radio tuned at 448.0 to pickup Tropez
900DX phone.
My 580T radio was also "enabled" to receive the 900 Mhz band by clipping
a wire. At 900 Mhz, I cannot hear audio my Tropez on the 580T. All I
hear is the radio static but signal strength meter on the 580T is "pegged"
indicating that the phone is transmitting.

Hope this helps.
Wai

I bought a 2006 a while back on the "no interest
no payment for 6 months" plan.
On the monthly statement interest kept appearing.

I thought maybe they would refund the charges
at the end as some outfits do.

Finally called today to ask about it because I wanted
to pay it off. When I asked they told me "Oh you had
some small charges.... and that is why there is interest."
This is something that I had kept careful track of. If I
made some small purchases I was sure to make a payment of much
more than any purchases I had made in that month. The
interest was on the entire amount including the "interest
free" purchase.

Anyway the point of this rambling discourse is that when
Rat Shack says "no interest" what they mean is they have
no interest in treating you fairly or living up to their
agreements. So watch your back when at the Shack

If Rat Shack management reads these news groups watch your
mail the four quadrants of my Rat Shack card are headed your
way. You got a few bucks you lost a good customer. Adios

>other differences.

The PRO-2006 has 400 channels vs. the 300 channels in the stock
PRO-2004. Also, the PRO-2006 scans and searches faster.

The PRO-2006 seems more sensitive than the PRO-2004. A check
of the front end filter circuitry shows slight changes in component
values.

x-------------- CUT HERE --------------------------------------x

- 1 -

THE RADIO SHACK PRO-2006 PROGRAMMABLE SCANNER

Copyright 1990, Bob Parnass, AJ9S

The Radio Shack PRO-2006 is a 400 channel, wide coverage
scanner radio, manufactured in Japan by General Research
Electronics. It is the successor to the PRO-2005 and a
grandchild of the PRO-2004, the super scanner which put
Radio Shack out in front of its competition in the base sta-
tion scanner market.1

The PRO-2006 is almost identical to the discontinued PRO-
2005, with the exception that the PRO-2006 boasts
HyperscanTM, a catchy way of saying that it scans fast --
about 26 channels/second versus the PRO-2005's 16
channels/second rate.2 At about $400, the PRO-2006 is $20
cheaper than the PRO-2005 was. Both scanners are built
using surface mount components and are housed in a gray
plastic cabinet.

Frequency Coverage

The PRO-2006 covers 25-520 and 760-1300 MHz, except for 2
gaps in the cellular telephone bands. The two gaps in the
800 MHz range can be restored in all the Radio Shack con-
tinuous coverage scanners by removing a diode. Diode D502
is the culprit in the PRO-2005 and PRO-2006.

A matrix of diodes, attached to the microprocessor's input port, is often used to configure radios for sale in different markets. The diode matrix on new the PRO-2006 is located on the vertical circuit board just behind the front panel. There are 2 diodes present, and holes drilled for 2 more.

Lots of Memory

---

1. "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

2. "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

The PRO-2006 has the usual features that scanner buffs have come to expect: individual channel lockouts, selectable 2 second rescan delay, an external speaker jack, etc. Casual scanner users don't need 400 channels, but scanner hobbyists can have those channels filled up in no time flat, especially with frequencies in the vast 225-400 MHz military air band, and other federal government allocations.

With so many channels to program, one dreads the thought of a power failure, which could clear memory in a hurry. Not to worry, the PRO-2006 memory is backed up by a conventional 9 volt alkaline battery (not supplied), which should be replaced every 6 months or so.

The 400 channels are divided into 10 banks of 40 channels each, and one can select or deselect any channel bank from the scan list. Individual channels can be locked out in the customary way, but the PRO-2006 maintains the handy feature introduced in the PRO-2004, a LOCKOUT REVIEW. Successive depressions of this key step through the locked out channels.

Scanners worth their keep have a priority feature, with channel 1 usually designated the priority channel. The PRO-2006 is more flexible; any of the 400 channels may be designated the priority channel. When the PRIORITY key is depressed, that channel will be sampled every 2 seconds, and the radio will stay there if a signal is heard.

The PRO-2006 has two scan speeds, which measured approximately 13 and 26 channels/second. While scanning at high speed, the PRO-2006 won't skip over weak signals like some of the AOR-2515 scanners do. Adding diode D501, situated at

an unmarked location between D502 and D503 sped up the PRO-2005 scan and search rates by 25%. Adding the same diode in the PRO-2006 has no effect on the scan or search rates.

It has been claimed that a PRO-2005 could be made into a PRO-2006 by merely replacing the CPU clock crystal with one of a higher frequency. Don't believe it. Changing the PRO-2005 clock speed would affect both the rescan delay and the priority rate, and they would no longer be 2 seconds long, as they are in the PRO-2006.

When programming a channel, the PRO-2006 firmware sets the mode automatically, based on its idea of what mode is most prevalent on that frequency. This feature saves extra keystrokes, and makes one appreciate the thought that went into the design of this radio. The default mode can be overridden easily, if need be, like to listen to a military mid-air refueling operation in the 225-400 MHz range, which is

mainly populated with AM signals.

Searching

The SEARCH facility found on most programmable scanners allows the entry of a pair of frequencies, then by pressing a key, the radio searches frequencies between those limits. The PRO-2006 allows for 10 pairs of limits! These pairs of limits are stored in their own memory, and don't use up any of the conventional 400 memory channels. One can set up several search pairs, for instance:

- 46.610 - 46.970 MHz: cordless telephones

- 144 - 148 MHz: the 2 meter ham band

- 418.625 - 418.900: Drug Enforcement Administration

Another unique feature of the better Radio Shack models is the MONITOR key, which stops the search and stores the frequency in one of ten special monitor memories. These memories are separate from the 400 main memory channels. The search can be restarted from where it left off by striking the up or down arrow key.

The user can select the search direction (up or down), and step size of 5, 12.5, or 50 kHz, although the PRO-2006 is intelligent enough to select a default step size based on the frequencies being searched. As on the PRO-2004 and PRO-2005, there is a hidden step size of 30 kHz, but this step size is only used in the cellular phone band after restoring full 800 MHz coverage.

The selected parameters are displayed on the LCD panel, smaller than the panel in the PRO-2004.

The DIRECT key allows one to start searching up or down from whatever frequency is on the display. Let's say the scanner is in MANUAL mode, and set at channel 26, which contains 460.100 MHz. Striking the DIRECT then UP-ARROW keys starts the PRO-2006 searching upwards from 460.100. This is a nice feature.

The PRO-2006 contains a "window detector" circuit, which is called into play during a SEARCH operation. This circuit tries to detect when the radio is tuned close to the center frequency of a station, and prevents the search from halting prematurely, off to the side of the signal.

- 4 -

The AFC (automatic frequency control) circuit of the Bearcat 800XLT often causes a search of 850 MHz signals to halt prematurely. Even though the signal sounds on frequency, the display reads the wrong frequency. Neither the PRO-2004 nor the PRO-2006 have this problem.

The PRO-2006 includes a SOUND SQUELCH, resembling the VSC circuit on the ICOM R-7000, which may be used during scan or search operations. With the sound squelch enabled, signified by a red lamp above the pushbutton, the scanner will skip over unmodulated signals. This is handy for skipping over "birdies", link signals with a constant carrier, or baby monitors when baby is asleep.

The manual warns that the sound squelch may be fooled by signals with low modulation, and skip over them. The PRO-2006 SOUND SQUELCH tries to detect the presence or absence of modulation (not human speech), so unfortunately, it thinks that noisy dead carriers, digital data signals, and paging tones are worth monitoring and will stop the scanner to listen to them.

Taping Facility

A tape recorder can be connected to the TAPE phono jack on the rear panel, which provides 600 mV of audio at a 10,000 ohm impedance. An audio filtering circuit rolls off the high frequency components before they reach the TAPE jack, which makes it impossible to use it for picking off FM subcarrier signals. In addition to a rear mounted external speaker jack, there is a miniature headphone jack on the front of the scanner.

The PRO-2006 lacks a COR (carrier operated relay) output, like ICOM R7000 and older Bearcat 300 have, which would be useful for actuating a tape recorder.

Basic Performance

To evaluate sensitivity, the PRO-2006 was compared with it's grandfather, the PRO-2004. Since a signal generator was not used, quantitative measurements could not be made. Instead, an Antenna Specialists AV-801 antenna was switched between radios, signals from stations were compared by ear, and the results tabulated.

Simply put, the PRO-2006 proved more sensitive than the PRO-2004 on all bands tested, and much more sensitive in the 850 MHz range. The earlier PRO-2005 was also more sensitive

than the PRO-2004, but both the PRO-2005 the PRO-2006 let 800 MHz trunked systems and cellular telephone conversations bleed through while searching the 118 - 132 MHz commercial aircraft band. The 800 MHz interference was heard on the 2005 and PRO-2006, not the 2004.

Although the PRO-2004, PRO-2005, and PRO-2006 can suffer the effects of intermodulation, they are much more immune than the overly sensitive, image laden Bearcat 800XLT. Intermodulation from paging appeared on several frequencies above 1000 MHz, in a region not many people monitor. Oddly, audio from television channel 50 was heard on 1251.625 MHz. The PRO-2006 has a 10 dB attenuator, operable by a slide switch on the rear. The attenuator helps eliminate intermod, but few people would want the attenuator enabled while scanning or searching as it degrades both wanted and unwanted signals. A programmable attenuator feature, selectable for each channel, would have been a better idea.

The up conversion design of both the ICOM R-7000 and Radio Shack PRO-2006 allows use of a very high IF (intermediate frequency), which helps avoid image problems.

The audio output quality is good, although the top mounted speaker directs the sound at the ceiling, but adding an optional external speaker allows the sound to be directed at the user's head.

Unfortunately, the audio level of AM signals is somewhat below that of NBFM signals, requiring a slightly different setting of the volume control, although this has improved over the PRO-2005. When scanning both AM and NBFM modes, one has to find a compromise position of the volume control.

The PRO-2006 squelch control has a small amount of hysteresis, an improvement over its GRE ancestors. Too much hysteresis is like having too much play in a car's steering wheel, or backlash in a gear set. This hysteresis forces one to keep the squelch at a tighter setting, missing weaker

signals when scanning or searching.

Mechanical and Electrical Construction

The newest scanners use tiny surface mount components, which permits manufacturers to cram more circuitry into smaller cabinets. This technology makes home repair and circuit modification almost impossible. The "lick and stick" parts are so small it's difficult to tell a surface mount resistor from a capacitor, and components are rarely marked with their values.

- 6 -

The PRO-2006 is smaller and lighter than the 2004. It is enclosed in a gray plastic cabinet, with a plastic front panel. If one is going to pay $400, one deserves to own some metal, but several stages are internally shielded in their own metal compartments. The entirely plastic cabinet of the older PRO2003 allowed wideband noise to radiate out of the scanner and into nearby shortwave receivers.

The PRO-2006 vertical front panel is an advancement over the sloping panel of the 2004. You can stack the scanner on top of other equipment and see the controls without standing up. If sitting directly on a table, two hinged plastic feet, padded with rubber bumpers, can fold out from under the front of the radio to tilt it at a good viewing angle.

There is a single BNC antenna connector on the rear of the PRO-2006, and the radio is supplied with telescoping antenna which screws in through a hole in the top of the cabinet.

Internal construction is excellent, and the internal shielding is commendable. Interstage shielding is very important in a wide band receiver, to prevent it from "hearing itself", an undesirable phenomena which results in birdies. The PRO-2006 owner's manual lists dozens of birdie frequencies. The shielding is much better in the PRO-2006 than in the 800XLT, which uses no shielding around the 800 MHz converter stage, and probably accounts for some of the birdies in the Bearcat.

Frequencies and other indicators are displayed on a backlit LCD (liquid crystal display) panel, and the level of backlighting can be dimmed by a pushbutton switch. As with the PRO-2005, the poor contrast on the small LCD panel makes it difficult to read a frequency more than just a few feet away, and is nowhere near as good as the greenish blue fluorescent display in the old Bearcat 300.

However, physically challenged and vision impaired scanner buffs will appreciate the conventional raised rubber key-

board in the PRO-2006, Only moderate pressure is required for actuation, and key depressions are confirmed by a mild "beep" audio tone.

The PRO-2006 is the right size to fit under the dashboard of intermediate sized cars, but there are few concessions to those wanting to use this scanner in a vehicle. Perhaps Radio Shack has been influenced by repressive laws restricting mobile scanners in a minority of states, like New Jersey.

- 7 -

Although it can be operated on 12 VDC, neither a mobile power cord nor mounting bracket are provided. These items were included with earlier, pre-PRO-2004 Radio Shack models. The AC power cord is not detachable, and would have to be bundled up to keep it out of the way in a mobile installation.

Owner's Manual

The user manual is much better than the fold out sheet furnished with Uniden scanner.

A single page frequency allocations chart is included, but is very general. Trunked radio systems are mentioned, but only briefly. Most people buying PRO-2006s probably have other scanners and so will be somewhat familiar with scanning.

The up conversion design of the Radio Shack PRO-2004/5/6 allows use of a very high IF (intermediate frequency), which all but eliminates image problems. Ironically, the PRO-2006 owner's manual contains a section on images. This section appears in the manuals for most other Radio Shack models, and was thoughtlessly included in the PRO-2006 manual. It babbles on about images being 21.4 MHz away from the real frequency -- true for simpler models, but not so for the PRO-2006.

There is no schematic. Thankfully, detailed service manuals for Radio Shack scanners are usually available for $12.00 or so.

The PRO-2006 is warranted for 1 year, which is reassuring.

What's Missing?

So with all these neat features, what's missing from the PRO-2006? It would have been better to have more channel banks with fewer channels in each bank, say 20 banks of 20 channels. A "search and store" mode, like that on the ICOM R7000 and older Bearcat 250 would have been nice, and such a

circuit is being marketed by Key Research. A lighted keyboard and a signal strength meter would also be welcome, as would a mobile mounting bracket and SCA output jack.

A frequency query facility, as found in the Uniden 200XLT, would have been very useful to finding in what memory channel a given frequency is stored.3 Mega-channel scanners

really need this feature and it would have been trivial to implement in the PRO-2006 firmware.

Summary - It's Tops

If all one wants is a scanner to monitor local police and fire, there are certainly cheaper and simpler models than the PRO-2006. This scanner is the best base/mobile scanner available at time of writing. AOR's AR-2515 has more channels, but its buggy firmware and tendency to skip active channels prevent it from taking top honors. At about $400, the PRO-2006 scans much better than the ICOM R7000, a great VHF/UHF communications receiver, priced at over $1000.

The PRO-2006 has the right features and performance, especially for scanning the wide 225-400 MHz military aircraft band and the newer federal law enforcement radio systems with their dozens of channels.

3063. Re: Carnival Cruise Line Freq's

Newsgroup: rec.radio.scanner
Date: 1995-03-11 21:32:27 UTC
From: kjn@netcom.com
Message-ID: <kjnD5Ap64.GqM@netcom.com>
Source record: 260388

John Fogg says:
" I'm going on a Carnival Cruise and would like to know if anyone knows
" any good freq's that the ship may be transmitting or receiving on.
" Either internally on the ship or externally such as ship to shore or
" navigational.

156.3 & 156.35 were used on the last cruise I was on to communicate with the shuttle boats. the following list will help if you don't have one already. The Carnival agents at the various ports also use the 156.35.

One of the first things I do when I get into my stateroom is to rig up the antennas across the outside window.

Several years ago we were on an NCL ship in the Gulf of Mexico and heard a "MAYDAY" on 156.8 about 1 in the morning (yes, the scanner stays on all night...). My girlfriend and I went up on deck and brought the scanner AND my ICOM handheld that covered the marine band. Our ship had stopped and the crew were using their search lights to aid in the search. They found some debris floating.

The CG had been calling the cruise ship on 156.8 but no one was responding. My girlfriend and I went up to the bridge and advised shift capt. that the CG was calling. We then used my hand held to communicate with the helo on ch 16 and 21.

Kind'a neat...

Last year we were in Jamacia and as the ship left the dock a passenger ran to the terminal. The local security held her up as they did a full search of the woman's bags. No GONGA there...

We were about a 1/4 mile off the dock and heading out to sea.
I again used my handheld and called the "Holiday Bridge" on 156.3.
I told them that they "...had left a passenger at the dock" .

The ship slowed. They called for a water taxi to bring the woman out. Unfortunately, the gangway was WAY too high for the small taxi. The crew of the Holiday had to quickly remove a window access on one of the lower decks pass out a life jacket to the woman, then bring her in thru the emergency access. It wasn't a graceful entrance...

Needless to say that everyone on board our ship ran from one side of the boat to the other as the water taxi came about to deliver the embarrased woman. Lots of yells and applause as she was *pulled* aboard.

Two morals here:
1) handhelds are fun on board,

2) don't be late for the boat!

A third incident occurred in Grand Cayman as we were getting ready to depart. One of the passengers got injured on shore and required hospitalization. The ships doctor left the ship and responded to the shore. There was a lot of traffic between the ship's security personnel and the bridge about the need for the doctor. The capt was hesitant to have the doctor away from the ship.

The ship was delayed for about an hour while the injured person was taken to the hospital and evaluated by local and ships doctors. Eventually, the ships stewards responded to the person's cabin and packed all their belongings and took them to shore. The injured man and his wife were left behind and were eventually flown home.

We were *very* popular on the ship since we were the only one's on the deck with a scanner so we knew what the problems were....

Yes, I'd certainly suggest that you take it along wth you - expecially while in port.

Regards;
Ken Navarre

Hi Mr.Wag - the name of the book you are looking for is the 'Guide to the AR1000', and is sold by many shops, including Grove Enterprises. It is written by Howard Bornstein, and as I recall, it sells for about $20US. I have the radio and an earlier version of this book; if you have one of these series' radios, this book is a must have....
Good luck Mike Agner KA3JJZ

With the current debate on where it is legal to have a scanner in the car, and where it isn't..I thought I would add my two cents.

What happens when you have out of state plates and get stopped in a state that outlaws scanners? It's happened to me, twice. Both in New York State, where I go to school..Once by New York State Police and once by a county sheriff...Both times, my Massachusetts Plates seemed to save me...There was no mention by either police officer about the three scanners and one two way radio in my car...

Has anyone else had these experiences, and what does the law say?

Some gun laws allow those properly licensed in other states to "pass through" the state carrying a firearm. Is the scanner law the same?

Just wondering..

They use inversion scrambling, I bought one and tested it for the very reasons you are asking. You will probably have to buy a 900 MHz phone to have a digital link. Be careful, they all tell you they are more secure than regular cordless phones, but most of them tell you it is because they use 900 MHz. Come on guys, every scanner made in the last few years has 900MHz, now how secure is that!

A company called Create sells log periodic antennas- fairly wideband- that will work well with scanners. They look like a tv antenna on steroids. The CLP5130-1 covers from 50 to about 1300 MHz, the CLP5130-2 covers from about 105 to 1300 MHz. The -1 is 7 feet long, and the -2 is 5 feet long. About $300 for the -1 and $200 for the -2. F/B ratio of about 15dB, gain 10-13dBi.

If you're interested in these antennas, they're carried by places such as Texas Towers, and ham radio stores.

To make effective use of antennas like these, you need to look at other factors as well.

1) Feedline. If you're going to be making use of one of these above 144 MHz, good feedline is a must- 9913 or Times Microwave LM400 at a MINIMUM.

2) Rotator/mount- polarization. If you're going to use it horizontally polarized, then a normal radio shaft rotator will do it. If you want to use it vertically polarized, then you need a 6 foot or so NON-CONDUCTING mast, and most likely a better rotator to handle the added wind load.

3) Receiver front end. Hook one of these up to a receiver with a crummy front end and you'll hear things you've never heard before- in fact, you'll hear things that don't exist as your front end is totally swamped.

I've got the CLP5130-1 up on the roof, fed by 9913. Works quite well for the amateur radio bands. It has been a big help for recent space shuttle missions that only peak up about 12 degrees above the horizon.

cheers-

ANY 250 memories in the 9000XLT may be alpha tagged, not just the first 250 (like in the 8500XLT). No cell mod is needed since the 9000XLT gets cell images loud and clear in the 360-385MHz range (NFM).

Jeff how have you been?

Do you feel like me that Uniden finaly has a very good base unit in the
9000.
Boy pricing for me on this model has been a nitemare to compete with.
From Grove at 499.00 to some Scanner World at or below 400.

Very strange never seen such a price swing as on this model.

IP>> Larry,
IP>> I'm monitoring them as I type. They have been on a trunk system
IP>> for over two years. There are 20 freq's listed to then, But I have
IP>> found they only use the last 10.

Actually, the police and all other public agencies use all 20 frequencies. However, the lower set (821, 822, 823 MHz) are the repeater input freqs. If a patrol car is within a few blocks of your scanner, you'll hear it. The upper set (866, 867, 868 MHz) are the repeater output. These are the only freqs you need to scan.

I've never heard any police units ask to bypass the repeater and use only the input freqs. (In fact, I don't think their radios are set up to receive inputs freqs. They would have to be a separately named 'talk-group'.) Detectives, on the other hand, do use digital encryption quite often.

I'm curious why you aren't the least bit geographic-specific. If you are in MA, for instance, what good will KS and WY frequencies do you? I don't have enough channel slots to worry about transmitters located beyond the range of my reception.

If you don't have access to any of: 'Police Call', 'Beyond Police Call', 'ScannerMaster', 'PopComm', 'Monitoring Times', or 'RCMA Scanner Journal', I would think that simply reading this newsgroup for a couple of weeks would fill up all the frequency slots your scanner will hold.

GOODYEAR BLIMP FREQUENCIES

By John (Topol) Johnson KWV8BP
Source: Monitoring Times

Here are a few frequencies you might want to monitor if you ever see one
of the Goodyear Blimps fly overhead. A couple quick notes first, there are
three Blimps in operation in North America a fourth is operated in Europe.
The American blimps are stationed at three locations, one on each coast
and one in-between. The Enterprise, tail number N1A, is based in Pompano
Beach, Florida: the America, tail number N3A, is based near Houston, Texas
and the Columbia, tail number N4A, is based in Los Angeles.
Each blimp is accompanied by a three vehicle ground fleet consisting of a
van, a tractor-trailer, and a Greyhound-like bus.

The communications between the blimp and ground crew are normally held on
151.625 Mhz. The blimp also uses VHF aircraft band, communications can be
monitored here at 132.00 Mhz. AM. Below is a list of other frequencies used
by the blimp.

123.050 Common Blimp port frequency

123.250 Suffield (Ohio) Wingfoot Lake Facility

132.000 Goodyear Tire & Rubber Company channel

151.625 Blimp Operations NBFM

465.9125 Blimp Operations NBFM - Low Power

465.9375 Blimp Operations NBFM - Low Power

465.9625 Blimp Operations NBFM - Low Power

This file was brought to you by John Johnson KWV8BP of The Hotline,

3093. Scanner Earphone -> CD Input, SBlaster?

Newsgroup: rec.radio.scanner
Date: 1995-03-12 06:06:21 UTC
From: woody@portal.apana.org.au
Message-ID: <woody.16os@portal.apana.org.au>
Source record: 260372

Hello there...

I have an Aor8000 which i use the earphone with a mono bud socket so i can hear my scanner clearly when driving which works quite well..

In my car I have a stereo that has a `CD Input' on the front so you can plug a discman cdplayer in and listen to CD's cheaply? in the car without buying a CD unit.. Anyway, can some one tell me if it would be OK to solder up a male<>male plug that would go from my scanner into the stereo CD input so that it is output on the speakers (Ill hear it then! :)..

CD Input Level = 250mV
CD Impedance = 600omh

Also, whats the go with say plugging the scanner into the MIC input of a Soundblaster 16 to digitize something thats being RX on the scanner?

I have also found in Melbourne (are there any Melbourne people out there) Australia, on 151.9500 Mhz NFM some form of TX that sounds like backwards speech! They play some music aswell as talk like general chatter and i just cant work out what it is, so i want to Digitize and flip it, or use some s/ware to invert and play it realtime like I have on the amiga...

I believe that you'll find that ham's aren't exempt with regards to just
scanners. They can have ham gear that scans, but not scanners. They
aren't exepmt.

On another note, some of the states that have laws outlawing mobile
scanners, I was just talking to a guy from one of the mid-west states
that outlaw them, sort of.. He said you can't have them without a
permit. Then it's ok. They just require you to get a permit to have a
mobile scanner in your car.

Ok, got the magazine. It's in Monitoring Times, Feb 1995. The ad is
from Communications electronics, Inc. Sportcat 150 handheld $178.95.

Credit card calls only 1-800-USA-SCAN.
Address: Communications Electronics Inc.
P.O. Box 1045, Ann Arbor, Michigan 48106-1045 USA

For info call 313-996-8888 or fax 313-663-8888.

Disclaimer: I haven't ever delt with them, and I don't know
anything about them. This is just a FYI only kinda post.

Try ham Radio Outlet (they have branches throughout the USA) and ask for
"The Pouch". It is made from the apdded nylon stuff they make wetsuits (or
maybe it is drysuits) for divers from. The small size should work, but the
clerk may be able to tell you better. The padding provides excellent
protection, but you have to remove the '43 from the case to get to the keys.

The original intent here is that many ham transceivers also can receive
public service frequencies. THIS is the real reason that many states
exempt hams from scanner laws.

Paul,
It looks like they put an older manufacture date sticker on
a newer unmodifiable scanner. I'd go by the serial number in determining
whether a scanner can be modified or not myself, since it's less likely to
have been messed with or swapped. But, given the fact that the serial
number on yours starts with an "A", I'd say you definitely got one of the
newer ones which can't be modified. Am I right that the date code you are
referring to is just a little paper sticker (which didn't belong on your
scanner)?

Terry

According to the FCC ID, you got one that won't take the 800 MHz
band expansion mod. Why would they modify one they were going
to discontinue? It was in the catalog for a year afterwards,
so I wouldn't say they were planning to discontinue it. The Pro 2006
was one they planned to kill, and that one never appeared blocked.

If you had opened it right away to do the mod and found that
the diodes were missing, you could have just taken it back if
the blocked bands bother you.

It's simple voice inversion scrambling. Any old Don Nobles decoder can
tune them in. (I have one and I can decode it.)

Just trying to keep the FAQ up-to-date.

It dawns on me that with all of the posts about *non*modifiable 3A4 units, I don't believe I've ever seen confirmation of a *modifiable* 3A4 unit. Has anyone seen one of these, i.e., 3A4 with no A in the serial number and no A at the *tail end* of the FCC ID?

Thanks.

Message-ID: <1995Mar12.194630.2829@beacons.cts.com>
Source record: 260340

I just bought a PRO-2035 and have a question. There are a few cellular frequencies within an advertised band range on this radio, and it is completely deaf on these frequencies. However, at least 1 business frequency in the same band range comes in fine. Does it actually lock out individual frequencies within a band? How do they do this? My PRO-39 has no problem with any of these frequencies.

Disclaimer: I do not monitor cellular frequencies, I am just curious as to the difference in the 2035 and 39's behavior.

Thanks for any info,

Kevin Sanders

What i did is put that radio 14$ antenna on a aluminum pole about 3 foot tall and just push it between the back support and the seat part of a folding chair and it worked great,now of course i have a discone antenna mounted in the yard,but its going up on the roof as soon as i take the plastice off the windows.
if you want to use something small,radio shack sales center loaded telescoping antenna that does great also, i have 2 of them for my portable scanners.

>any way I can increase my range, say with a booster, different antenna?

Get yourself one of them discone antennas radio shack sells,i had one of them
little cheapy jobs and it really sucked,but when i got my discone ,it was
great and worth the price also.
You can also get an amplifier like gre sells they have them for base and
handheld scanners. I bought one but i only use it when i here something
interesting that is weak. All 4 of my scanners pick up great with no problems
sometimes i even hear as far as the next state.
Now hooking up cable (this is my opinion)isnt to great because the signals
on there were put there on purpose they arent hooked up to any big antenna on a
hill some where,at least my arent around here.
You can hear all of the cable channels audio if you hook up cable to your
scanner.

: >The original intent here is that many ham transceivers also can receive
: >public service frequencies. THIS is the real reason that many states
: >exempt hams from scanner laws.

: I believe that you'll find that ham's aren't exempt with regards to just
: scanners. They can have ham gear that scans, but not scanners. They
: aren't exepmt.

: On another note, some of the states that have laws outlawing mobile
: scanners, I was just talking to a guy from one of the mid-west states
: that outlaw them, sort of.. He said you can't have them without a
: permit. Then it's ok. They just require you to get a permit to have a
: mobile scanner in your car.

No, at least in Indiana, the law is in reference to receivers that can
pick up police calls, and specifically exempts persons holding a ham
license. I think a lot of states are like this.

The FCC says that no state can outlaw a ham transceiver that picks up
police freqs, but does NOT address scanners.

BTW, non-hams can get a permit here, too. Also reporters are exempt.

3136. Sangean ATS-803A for sale

Newsgroup: rec.radio.scanner
Date: 1995-03-13 02:06:00 UTC
From: chris.smart@canrem.com
Message-ID: <60.15830.5773.0N1D5265@canrem.com>
Source record: 260354

Hi. I have a Sangean ATS-803A general coverage receiver for sale. Its
the same as the Realistic DX-440.
Its a portable general coverage receiver that receives 150 KHZ-30 MHZ
continuous coverage, receives am sideband and cw, also receives fm and
fm-stereo from 88-108 MHZ.

- can be run from wall adapter or batteries
- internal, telescopic whip, or can be connected to an external antenna
- din plug can be used to hook this radio to a tape recorder,
- with headphones or with your stereo (through the radio's 1/8 inch
headphone jack) you get FM broadcasts in stereo
- rf gain, bfo, bass, treble, balance, and volume controls
- ten memories for your favorite stations
- direct frequency entry via number keys 1-0
- can tune in steps with knob or up/down keys
- will scan for stations/signals
- built-in clock with alarm
- lock switch prevents accidental key presses
- also has narrow/wide receive switch for narrowing bandwidth

I have the radio, the manuals/paperwork for the radio, and the
wall power adapter for the radio. Unfortunately, I cannot
sell the radio with a pair of stereo headphones, but all you
need are your standard walkman type, or anything with a 1/8 in
plug.
This radio is in fine shape, except for a broken telescopic
whip antenna which needs to be replaced. (most of the antenna
is there, but a couple of the end sections broke off a year or
so ago)
Reason for selling: I have one of those great little Sony's,
so don't need this radio.
I'm going to leave the asking price wide open on this radio.
I paid $275.00 a few years ago for it, but have no idea what
they're going for used these days.
Please reply via any of the following methods:

Message-ID: <60.15828.5773.0N1D5263@canrem.com>
Source record: 260355

Hi. I have the following equipment for sale. If you are interested in any of the following, want to make an offer, ask for more information, and so on, here's how to contact me:
Mail addresses: Internet: email to chris.smart@canrem.com, Fidonet: netmail to 1:229/15, Rime: private/routed mail to ->crs.
Phone (voice): 519-756-9389 (if I'm not around, just leave me some voice mail)

1. 15-20 amp power supply.
I have a 15 amp homebrew DC supply for sale. This thing is better built then most of the commertial supplies I've seen/used, is very solidly constructed, doesn't get more then slightly warm when supplying 15 amps at 13.8 volts DC.
I didn't build it, but I can certainly atest to its high-quality. The four big transistors at the back are rated at 5 amps a piece, so it'll probably put out close to twenty amps if pushed. DC voltage is also variable; (currently set to 13.8).
I'm looking for about $80.00 Canadian funds for it, since its in absolutely great condition, and was hardly used. (price is negotiable)
Reason for selling: I am saving up for a decent acoustic guitar, a dualband HT, and other things.

2. Ten-tec Argosy II

Yes, I'm parting with it, after 6 years of great performance.
Features: extremely small solid-state rig; great beginner radio for people with a low budget, perfect for mobiles, a great backup rig for emergencies or up at the cottage.
- 5 or 50 watts ssb and cw,
- transmits upper and lower sideband, cw, (automatically ofsets transmitter when switched over to cw)
- transmits and receives on 80, 40, 30, 20, 15, and 10 metre bands. (10 m is split into four band selections, 28.0-28.5, 28.5-29.0, etc.)

- great notch filter for eliminating carriers
- digital readout for frequencies, power/swr/signal meter,
- comes with Ten-tec power supply, d-104 desk mike that looks aweful but is a perfect match with this radio,
- also comes with voice readout for frequencies, (great for white-caners like me)
Reason for selling: I'm just not interested in keeping this thing around any more. I have almost lost all interest in HF, and will buy a better radio when I get back into the low bands. Furthermore, as I mentioned above, I need the money for other things.
History: For the first year after I purchased this radio, I was

constantly replacing fuses in the power supply, and the radio was pretty warm even with almost perfect swr readings. Then, the voltage regulator went for good in the power supply, blowing the two big transistors in the finals. $138 later, the supply and radio were fixed, and I have had no problems since. No blown fuses, no overheating problems, etc. It works great, except for the following minor problems. The plastic knob on the
mode-change control can be removed by simply sliding it off its post. There is no longer a knob on the notch filter control, but this could be easily remedied. Also, the RIT control needs to be lined up again. In other words, when the RIT control is in the middle of its range (transmit and receive are on the same frequency supposedly), transmit is down the band about 1.5 KC's from where the receiver is. I just turn the RIT to correct this, but its annoying having to have it permanently set wrong.
I'd like $450.00 or best offer for this rig, power supply, voice readout, d-104 mic. I still have the manuals and paperwork as well. If you don't want the d-104, I'll probably just throw it out as its so beat up.

3138. Dualband HT HELP??

Newsgroup: rec.radio.scanner
Date: 1995-03-13 02:06:00 UTC
From: chris.smart@canrem.com
Message-ID: <60.15829.5773.0N1D5264@canrem.com>
Source record: 260356

Ok, once I sell my small HF rig and power supply, I plan on buying a dualband HT. I haven't had any experience with any 2 m or 70 cm equipment for years. The last handheld I owned was an Icom IC02AT; I loved it. I'm looking for something with the following features:
- direct frequency entry via a number pad, (I can't handle those little switches or thumbwheels as I can't see the display)
- 4 or 5 wats output on 2 m and 70 cm
- a hot little receiver that doesn't get constantly overloaded with intermod (I'm in a city of about 80,000 people, so the intermod problems aren't extreme here yet)
- at least 10 memories per band
- CTCSS capability on both transmit and receive, (very important on receive)
- extended receive capability, (not just the ability to make the display go out of band on receive). This would get rid of the necessity for a scanner to monitor the weather stations and a few other frequencies.

Also, what are the battery options on HT's these days? It would be nice to get something better then a nicad pack, such as the NiMH batteries available in most notebook computers these days.
Oh, by the way, I was originally considering just getting a 440 MHZ rig to avoid the conjestion and interfearance on 2m, but I figure I may as well just get an HT with both bands for what its worth.
Please let me know what you're using, approximately what its worth new, what you like/dislike about it, etc. Can you get antennas better then a rubber duck for these things that work on both bands?

Thanks and 73, ve3 sht.

From: mike581@aol.com
Message-ID: <3k0ept$1po@newsbf02.news.aol.com>
Source record: 260362

Mike,

The 10.xxx freqs. are not the rec. freq, they are the fundamental (1st oscillator) xtal frequencies. These are multiplied by some constant (depending wheather the freq is VHF low, VHF High, UHF, etc.) and then the intermediate freq (usually 10.7 or 10.8 Mhz.) is subtracted from that number to get the actual recieved frequency. If the scanner is an older model and you have the owners manual, this information might be listed there. As for the 37.85, it sounds like something in the Power/Utilities Radio Service, although it would have to be 35.84 or 35.86 Mhz. as that portion of the spectrum is spaced at 20 khz. intervals (even numbers)

3143. PRO-51 Keypad Codes

Newsgroup: rec.radio.scanner

: Actually, several cellular companies are scrambling signals. Cellular
: One here in Chicago uses a digital scheme to protect the signals.
: Ameritech is supposed to be switching to digital soon.

: Jerry
:
: ___ Blue Wave/QWK v2.12

If cellular companies decide to go to digital, or scramble all of their signals, then wouldnt the people that already own cellular phones have to purchase descramblers or modify their existing cell phones? That would get kind of expensive, and the average everyday cellular user wouldnt want to pay big bucks just so some punk kid w/ a cheap scanner can monitor them, (unless of course the cellular user really needed the privacy if he/she was doing something illegal)

: like it very much. Would like to compare notes with other users.

: Ken
: (ken@mitre.org)

: My opinions are mine own.

Yes! I cant believe it! I thought that I was the only one with that thing. I cant find anyone else out there that has one, or knows of where in the world I cant get the modification docs on that thing. I have uses for it ouside the ham bands to xmit on it, (legal uses by the way) and would love to get the full potential out of that radio, but cant find the docs.

Are you using it as a full remote, or do you have a faceplate for it too? Personally, I just use the remote, cause there is no where to put the brain under the dash in my car, so I just have it coming out from behind the seat, and it works well, it's not in the way, and deters theft cause I can hide it easily!

3151. Beartracker w/ alert light

Newsgroup: rec.radio.scanner
Date: 1995-03-13 05:06:49 UTC
From: cadsuper@big12.metrobbs.com
Message-ID: <3k0jt9$3ij@metroux.metrobbs.com>
Source record: 260370

Anyone familiar with the beartracker from Uniden? The mobile "pre-programmed" scanner that is in every truckstop from Maine to L.A.? It has a red light and warning buzzer that is supposed to sound when you are within so many miles of the signal being transmitted. This is for truckers, etc. for if a highway patrol is keying up on his radio just a mile down the road, the buzzer is supposed to kick on and alert the rig driver that smokey ain't far.

This sounds all good, fine, and dandy, but if the highpo is using a radio that bounces of a repeater, and the truck driver is listening to the output frequency of the repeater for all the information, the radio would not sound the warning buzzer and turn on the warning light cause the repeater is 10 miles away, but the officer and the radio (which are transmitting at the repeaters INPUT frequency, not the same one the truck driver is listening to) what good will it do to have all those lights, and buzzers to alert the driver? Ive heard several theories on this from people who dont have a clue, and cant accept their explinations cause they dont make any sense.

Am I missing something here, or is this just another one of Uniden's marketing techniques to sell these radios to the average truck driver that dosent know much about radio propogations?

MRE (Mobile Repeater Extender). Most Troopers use UHF to talk to their cars, which act as a mini repeater to send the signal via VHF or HF (Longer distance than UHF) to the HQ that might be many miles away.

Since the UHF is only line of sight, the trucker can be assured that the trooper is near. You could also monitor these UHF frequencies with any regular scanner and don't need the bear tracker light.

Take Care

hi chun, to answer your questions, yes it is possible, it can be done by tuning the scanner to the frequency of the phone in question, usually (i believe) 40-50 Mhz. to prevent it, either a) quit using a cordless phone, b) buy one of the newer cordless phones with base to handset scrambling. if it is any consolation to you, monitoring cordless phones is illegal, so i am sure that no one will do it. haha.

Yes, that will get expensive, that is why the present cell system will be
here for quite a while. Don't expect any overnight changes.

> Can someone give me a quick breakdown on the 450-470 MHz band in
> Holland? Even more particular, 464-467.

Ok, here is a quick one :
461.3100 - 465.7300 ATF-2 cellular mobile phone network (relais-stations)
465.7500 - 466.4700 Porto/Mobile use private and governement.
466.4900 - 467.2100 Police porto freqs. (repeaters)

I took it from the KLOVE manual for scanners.

3176. FTR-5 Scanner Filter Help Please...

Newsgroup: rec.radio.scanner
Date: 1995-03-13 14:48:40 UTC
From: domonkos@access.digex.net
Message-ID: <yh5PliubGwz3079yn@access.digex.net>
Source record: 260244

Has anyone had any luck using the FTR-5 scanner filter by Grove? I'm planning on using it with an 890XLT dual conversion scanner that has several freq ranges apparently getting hit with TV image interference. Wondering if this filter will help eliminate that. Thanks...

Andy

3177. High Freq Sound Filter-How do I make one?

Newsgroup: rec.radio.scanner
Date: 1995-03-13 15:06:38 UTC
From: ptcarter@b30news.b30.ingr.com
Message-ID: <3k1n1u$300@b30news.b30.ingr.com>
Source record: 260245
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Let me first say that I'm not fluent in electronics, so this may be an easy one. My question arises from something I noticed about my scanner. I listen to it through headphones a lot so as not to disturb my wife. As I was returning from answering natures call, I noticed a high frequency sound in the room, and I was a pretty long way from the headphones that were laying on the nightstand. As I got closer, I realised that this sound was acutally coming from the headphones. I thought-This has got to be hard on my ears over time. So my question is, Is there anyway to filter out these tones and leave just the desired audio? Note this sound comes when I'm listening to frequencies in 870-896 MHZ range .

Thanks for any assistance.

Paul ptcarter@ingr.com

They go for about $479 brand new, although the newer ones may be 869-894
blocked. At least you are becoming more reasonable from your original
post wanting, what was it, $750? The R1 is known to be a cheap receiver
and I would personally pay $50 more for a MVT7100 or $150 more for a AR8000.

> is that true? How can it be done? How to prevent it?
>

I have monitored cordless phones up to 5 Kms from my location. So if you
are concerned use a regular landline. BTW monitoring cordless phones is
illegal in the USA (ya, right!) but it is legal here in Canada. I would
suggest that you use common sense and not give out personal info over
a cordless phone, ie: Credit Card numbers etc...

You could use your hand held scanner and an external amplifier like the
radio shack amp speaker. It has a neat light that goes on when ever the squecl opens and
gradually fades after the audio signal is lost.

I find it useful when listening to several radios to notice which one had the siganl on it.

Richard Williams (richlw@moose.erie.net) typed:
: Hi All,
: Just received a catalog wherein there are advertising a Uniden Bearcat
: hand held scanner; no model number given. Anyway, it has "Turbo-Scan",
: which supposedly scans 100 channels/sec. "Has data skip and memory
: backup that retains frequencies for up to three days without batteries.
: Rechargeable ni-cad battery pack, AC adapter. Price is $200. Seems a
: little steep, but I thought I would ask for the opinions of more
: experienced scanner users. Good buy?
: Thanks,
: Dick

Sounds like my SC150. It will search (in the lower freqs. below 500 MHz)
at a rate of 300 chs per sec, if I remember correctly. It has data skip,
AC adapter, Ni-Cd pack, and 10 programmable freq banks with a direct mode
for the first ten channels (out of 100). It cost me about $210 with tax
at the Wal-Mart back home in Geneva, NY, in June of 94. It is a pretty
good scanner for the price, and will allow for some cell freqs. and a lot
of cordless freqs (if you're into that stuff), but it has served me well
as a recreational scanner...

The local police department here in Rolla, MO has an annoying feature in its radio system, in that it is continually broadcasting. It is not always on, but when I do catch the frequency when it is free, it is not more than a few seconds before they transmit. It sounds almost like someone forgot and left an open mic, since it is not static noise. Is this similar to what I read in a previous thread (I think it was '800 MHz is impossible') where they describe the repeater as sending out a broadcast. Note that the frequency does not skip around like an 800 or trunked system. I am just wondering if there is any way I can succesfully scan this channel without being stuck on it?

3207. Don't expect privacy on cordless phone

Newsgroup: rec.radio.scanner
Date: 1995-03-14 00:48:16 UTC
From: RSC@sruvm.sru.edu
Message-ID: <1736011680S86.RSC@sruvm.sru.edu>
Source record: 260275

This article was in tonights newspaper, thought you'd like it:

"DON'T EXPECT PRIVACY ON CORDLESS PHONE"
By "The Arizona Republic", Tucson, Ariz.

"Drug dealers and everybody else should know not to expect privacy when they talk on cordless telephones, the Arizona Court of Appeals says.

In a unanimous decision, the court's Tucson division has rejected Ana Patricia Duran's argument that a search of her home, during which large bags of marijuana and drug paraphernalia were discovered, was based on an illegal wiretap.

Police got a search warrant after Duran's neighbor, an off-duty sheriffs deputy, intercepted her cordless-phone conversations with his radio scanner.

Duran later was found guilty in Pima County Superior Court of possession for sale of marijuana and was sentenced to five years in prison. She appealed, arguing that the search of her home violated wiretap laws and, therefore, the evidence found could not be used against her.

Wiretap statutes protect wire, electronic and some oral communications from unauthorized interceptions. Under the law, the radio waves between a cordless-telephone handset and its base are not considered wire or electronic communications.

Based on the widespread use of cordless phones and the common knowledge of how they work, Duran had no reason to believe that her talks would be confidential, the court said in its Feb 28 opinion."

In a previous article, orkin@delphi.com (BIGBOY) says:

>Does anyone know if there is any video on the 800-900 mhz,like for news channels
>or amateur video?
>
There is nothing in the 800 MHZ band but the 900 MHZ band contains
Amateur ATV on several frequencys in the 900 band.
Also the video Rabits that you see in stores run in the same band also.
Look for both between 902 and 928 MHZ.

They still have a few of the old ones in the 155-157 mhz area,
but they are quickly shifting to 800 mhz, and by the end of the
year will be using a digital trunking system made by GE..

You might want to try 155.790 for starters..

3213. Why have gaps in legal ranges?

Newsgroup: rec.radio.scanner

O.K., I understand why manufacturers take the time to put in frequency gaps wherever there are legal implications, but why spend the time/money to put in gaps where there are no legality issues.

Lets say a scanner manufacturer wants to cover from 1Mhz up to 1Ghz - block out cellular, cordless, or whatever - fine. Why block out AM, FM, TV, CB, and whatever else may fall in range? I'd love to be able to carry one device on vacation that doubles or "quads" as a regular scanner, radio, CB receiver (for hearing about traffic conditions, etc), and the audio track of my favorite show which I might otherwise miss out on, etc. etc.

>my window, but nothing in the standard AM band. What does the
>transistor radio have that my scanner doesn't? (I can get standard FM
>broadcasts as well as TV audio).
>Thanks.
Most scanners don't go low enough in frequency. Most don't go any lower than 25MHZ. 1160 Khz is 1.160 Mhz.
If yours does go that low, make sure you are in AM mode. The limiters in FM mode will not allow
amplitude modulation (am) to be detected.

3216. Which scanners have CTSS capability

Newsgroup: rec.radio.scanner
Date: 1995-03-14 03:10:09 UTC
From: erk@netcom.com
Message-ID: <erkD5Eu4y.C9C@netcom.com>
Source record: 260285

I've been looking at the new line of scanners out these days and have
been sorely tempted to update my old bc200xlt to something that has
a few more bells and whistles. I read a posters opinions of the bc9000xlt
in an earlier post and was curious about the CTSS option that he mentioned
he was going to get for his scanner.

I had always beleived that CTSS was only usefull for x-mitters to turn
on a repeater for transmitting, I was corrected bye the poster who noted
that it is also usefull for recieving with the new polling systems
that the local agencies (are starting to ?) use. For instance:

I've been told that Sacramento County will be upgrading their radio system
to a newer polling system. This system will have say .. ten channels for
ALL of the agencies, but any one of these channels could be used by any
agency, while maintaining privacy from interferance from any other agencies.
Am I making myself clear ?

In other words:
given these freqs. the person keying the mike in a sherrifs car could end
up on any frequency ,

On the first key up lets say channel 3 @ 453.020

1. 453.000
2. 453.010
3. 453.020 Sherrifs (first key up)
4. 453.030
5. 453.040 Sheriffs (third key up)
6. 453.050
7. 453.060
8. 453.070 Sherrifs (second key up)
9. 453.080
10. 453.090

On the second key up he may end up on channel 8 @ 453.070
On the third key up he may end up on channel 5 @ 453.040

As you can see this will make scanning in the traditional sense obsolete!

It will be impossible to follow a conversation as the frequencies are
shifted constantly.

To Complicate matters, there will be other unrelated agencies using these
same ten frequencies, constantly intermixed with sherrifs, the dog pound
and the tree trimmers , etc.

If they do in fact use tone decoding for ferreting out the receiving
stations then this CTSS mod would be mucho usefull. If on the other
hand they use digital decoding then it would not, quite possibly
making the situation impossible. As I understand the radios do have
digital signatures (I've not only seen , but have used these radios)
They are programmable in ways in which our experts at the radio shop
are still not aware of (since I talked to them about 6 mos. ago that is)
In this worst case of digital decoding, will scanning be impossible ?

For now I am hoping that the decoding will in fact be tone decoding.

So I ask: Are there scanners that are available for decoding CTSS tone
codes and (hopefully) digital codes for keeping the scanner on track of
a conversation going on for any particular agency ?

Or should I just hang up my scanner and go back to watching sitcoms :-/

Listen on 145.550 FM
both voice and packet (computer) radio.You will get only a nine minute
window period when they are overhead.

You can actually see them with the naked eye at altitudes above 30 degrees.

DEFINATELY get a tracking program and the necessary data to see where the
shuttle is at all times, especially so that you may predict when it will
be overhead.

I made a contact from here in So Cal about 20 minutes ago. VERY cool.
Looking forward to getting a QSL card.

Another pass will be here a little after 9:00 pm. I am hoping for a
voice contact. 73 to all, and good luck.

For those in So Cal area, I have the predicted times estimated:
for 3-13-95 local time to LA
21:05 to 21:13 11 deg high at 198 deg clockwise from due north
22:44 to 2:47 1 deg high at 207 deg (forget this one... too low)

then the next good one is at 95,14,03 at 18:16 to 18:26
it will be 26 degrees high, at 181.4 deg clockwise from north.

Sorry that I only have data for the So Cal area. I don't know how to
program this thing for other areas. Someone else set me up for So Cal
Anyway, when you hear activity on 145.550 MHZ, they are
within your circle of view.

Dan

3222. Need 900Mhz cordless phone frequencies

>
>Anyone familiar with the beartracker from Uniden?

The freq it uses to trigger the alert light is used by the mobile extender (a mini-repeater used only between the patrol car and the officer's portable radio).

Two very important things the Beartracker ads don't tell you:

1. The mobile extender is on ONLY when the officer is OUT OF THE CAR. Therefore, (A) if he's sitting in his car watching the readout on his radar unit as you came barrel-assing over the hill, the mobile extender is not on and the Beartracker ain't gonna save your ass no way, no how, (B) if he's out of his car using his portable it means he's busy with something/someone else and probably not interested in you, anyway.

2. Not all states have mobile extenders in their patrol cars.

The bottom line on the Beartracker is: buy a real scanner and the latest edition of Monitor Amercia.

From: marc_k@escape.com
Message-ID: <3k3jcu$1rj@beyond.escape.com>
Source record: 260294

Those other tones you mention are NOT DTMF..they are called MF!
These are used for inter-office signaling(mostly for long-distance calling).
They are not used as often as they used to, since many carrier offices
communicate digitally using a system called CCIS.
This is a digital out-of-band signaling system(the one using the MF tones is
in-band signaling).
P.S. in case you are wondering..yes there used to be a method of evading
phone call billing using the MF tones(the infamous "BLUE BOX").
Needless to say, since most trunks are using CCIS now at days, this is
generally more trouble than it's worth).
If you are looking for more info on this topic, you might want to check
out alt.2600
Look for the alt.2600 FAQ as well.

>So my question is, Is there anyway to filter out these tones and leave
>just the desired audio?
>Paul ptcarter@ingr.com

Solder a capacitor across the headphone output jack. You might have to experiment a little to get a value that knocks the high-freq buzz down while not killing the desired audio. 0.5-10 uF is about the right range. You can get much more complicated than this, but this is one simple method - $1.

Next up the scale is an op-amp active low-pass filter or notch filter. See the ARRL Handbook or one of the op-amp "cookbooks" for circuits - $10.

Next is a fancy Digital Signal Processor that digitizes the audio, crunches it to remove whatever you tell it to remove, and spits it out as audio - $100.

> I'm having problems picking up any mobile broadcasts further than
>5 miles. I have a simple "three-prong" antenna on the roof. Is there
>any way I can increase my range, say with a booster, different antenna?

Tell us more about your current antenna. I don't really know what a "3-prong"
is. What type of feedline are you using - coax? What type?

"Boosters", i.e. preamps are difficult to do right. Get everything else right
first.

>I don't really want to go higher if I don't have to.

Once you're outside and on the roof, it's tough to get much more signal by
going higher, unless you happen to be just below a hilltop that's blocking what
you want to hear.

>Also a friend of
>mine said he heard you could get an adapter for your cable T.V. line and
>hook it to your scanner and pick up everything. Anyone hear of this?
> Dan Poe

Sure, you can pick up the cable TV broadcast audio. I don't think that's what
you're looking for. Or maybe it's some screwball gadget that turns the shield
of the cable into an antenna. I wouldn't bother if so. The cable might or might
not be a better antenna than what you already have - probably not.

I'm planning on flying via US Air. Any ideas how they feel about using scanners on the plane now?

Also, could I carry an HT on the plane (I have no plans to use it while anywhere near a plane)?

Dishheads, dishheads, roly poly dishheads!
Lick a toad, go to jail.
See Spot run. See Spot Dick Jane.

3236. PRO-43 Modifications FAQ

Radio Shack PRO-43 Modifications FAQ
CONTENTS

1. Introduction
2. Which units can be modified for extended frequency
reception?
3. Companies that will modify the PRO-43 for extended
frequency reception
4. The modifications
extended receive (original mod + solderless)
keypad beep delete
improved audio
attaching an S-meter
400 memory channels

---

1. Introduction

Because there is a continuing demand for it, this mini-FAQ about PRO-43 modifications will be posted every two weeks until there is demand for its removal. In large part, it is the file PRO43.MOD from pub/hamradio/mods/tandy at oak.oakland.edu .

The FAQ now includes mods for

(1) extended receive (original mod + solderless)
(2) keypad beep delete
(3) improved audio
(4) attaching an S-meter

There is also a mod for 400 memory channels, but, to quote its author, it is very complicated, should only be attempted by someone with moderate to advanced electronics experience, and is not for the faint of heart or the "weekend technician." A brief description is included at the end of this FAQ. If the mod were included in its entirety, the size of the FAQ would be increased four-fold.

---

2. Which units can be modified for extended frequency reception?

Note: It is against the law (Electronics Communications Privacy Act of 1987, public law 99-508, amended 1994 by public law 103-414) to listen to cellular or cordless telephone communications. However, it is not illegal to own equipment that can receive or can be modified to receive such

communications, even though it became illegal as of April 1994 to manufacture or import equipment that could be easily modified by the user to receive cellular communications. Equipment manufactured before the cutoff date can continue to be sold until stocks are exhausted. While businesses are forbidden from importing cellular capable scanners for resale, the question has been raised whether an individual can legally import such equipment not intended for resale. The issue is not explored here.

Which PRO-43 units can be modified for extended receive?

Modifiable | Nonmodifiable
|
serial number no A in # | begins with A
FCC-ID AA020-300 | AA020-300A

Inside the battery compartment is a paper label containing the date of manufacture in the form "month A year". For example, 5A3 is May, 1993. The cutoff date after which units could no longer be modifiable is April, 1994 (4A4). So far, the earliest reported date of manufacture of a nonmodifiable unit is 3A4 (March, 1994). [There have been *no* reports of a modifiable 3A4 unit.]

The PRO-43 was produced under two brand names. My 3A3 unit carries the Realistic name; my 12A3 unit carries the Radio Shack name. At the moment, it is not known whether this represented a changeover or whether both types were produced side-by-side for a time. It is also not known whether their electronics are different.

There are no software modifications for the PRO-43. It is not possible to extend the frequency range of the radio by pushing buttons on the keypad. Such modifications are possible with other models, such as the PRO-51, but *not* with the PRO-43. The PRO-43, made by GRE (General Radio Electronics) of Japan, is one of Radio Shack's few triple conversion units. Radio Shack scanners with software mods are double conversion units made by Uniden.

Modification procedures for other radios are available by anonymous ftp from the pub/hamradio/mods/<manufacturer> subdirectories at oak.oakland.edu.

There is some debate about whether step (5) of the extended receive modification is worthwhile. According to Bob Parnass, from his "Improved Audio Mod", below:

"Now that I have a schematic, I see that the European version of the PRO-43 has different coils and capacitors in the low (mid) band front end filter. That explains why the 75 MHz sensitivity isn't stellar

after adding diode D3 to enable 30-88 MHz coverage."

So, if you trash the diode in step 4 or want to quit while your ahead, don't lose sleep over it. On the other hand, quoting ray_reese@tscnet.eskimo.com (Ray Reese),

When I purchased my PRO-43 and did the mod for adding 54-88 Mhz, using the removed cell. diode, I wanted to be able to listen to the sound carrier for the tv channels 2-6 as well as the 72-76 Mhz band. It is worth the trouble to make the mode and it does work well in my area, despite not having the correct coils for that band area. Do the mod anyway, but [if you've trashed your original diode], use a 1N4148 fast-switching diode. Perhaps a 1N914 might do the job also. They can be found at Radio Shack for a cheap price.

---

3. Companies that will modify the PRO-43 for extended frequency reception

If you'd rather not do the modification for extended frequency reception yourself, Cellular Security Group, 106 Western Avenue, Essex, MA 01929 (508/768-7486) will do it for $40, which includes insured UPS return postage. However, CSG will not move the diode to extend the low band to 88 MHz; they only remove the diode to unlock the 800 MHz frequencies. When CSG is mentioned on the net, two types of comments follow: testimonials from satisfied customers and comments from those with the technical skills claiming that the service seems high priced for just removing the diode. But, there have been *no* reports of shoddy work or damaged radios. (They've modified two of mine.) Units are processed within 24 hours of receipt.

Grove Enterprises' newly advertised Repair Service will perform the mod for $40 plus shipping. They will move (rather than just remove) the diode in units that can benefit from it, but state that there is no way to tell whether the diode should be moved without looking inside. They claim that the determination can not be made from the serial number, FCC-ID, or date of manufacture. For further details, call Grove at 704/837-7081. In order to get a unit modified, a service order number must be obtained from the same telephone number. Packages without a SO# will be refused.

---

4. The modifications

From: armille@afterlife.ncsc.mil (A. Ray Miller)
Summary: cellular (870-890 MHz) and low band (51-88 MHz) restoration for PRO-43

A few people have mentioned the cellular mod for the PRO-43; it turns out you should not remove but MOVE the diode. Doing so allows cellular coverage as well as low band (up to 88 MHz) coverage.

Acknowledgments to Grove Enterprises; this information came from them. They are selling the PRO-43 for $300 which is $50 less than Radio Shack. I have no connection with them other than as a satisfied customer.

PRO-43
Cellular Frequency Restoration and Low Band Expansion

Note: It is not lawful to monitor cellular or conventional mobile telephone conversations.

The following procedure requires familiarity with microcircuit soldering and will violate your warranty. Grove Enterprises assumes no liability resulting from its attempt, nor will accept the modified scanner for return under any condition.

TOOLS NEEDED: Fine point, low power soldering pencil; solder wick or a desoldering tool; pointed awl, hemostats or pointed tweezers; small Philips screwdriver; solder.

1) Remove the battery, antenna and back cover (held in place by four screws).

2) Remove the six screws holding the top circuit board in place. Carefully unsolder the two antenna connections from the board. Bend the antenna ground tab fully up from the board. Carefully lift the board, unplugging the black connector at its base, and lay the board out of the way on its bundle of colored wires.

3) Remove the two screws from the next board and lift it, carefully unplugging the white connector at the bottom of the board. Lift it up and lay it aside on its brown wire (which can be unplugged if necessary).

4) Unsolder and remove the metal shield from the final board, revealing the microprocessor; note the row of diodes labeled D1-D5 above it. Only diodes D1, D2, and D4 are present; assisted by a pointed tool, unsolder and remove D4, the lone diode (this restores cellular frequencies which will be searched in 30 kHz steps).

5) Resolder the removed diode carefully into position D3 to extend low band coverage to 88 MHz.

6) Reassemble the boards, paying particular attention to the alignment of the plugs. Test the radio by entering any frequency between 870 and 890 MHz (cellular) and 51-88 MHz (low band).

From: IN%"savage@dg-rtp.dg.com" 2-FEB-1995 17:55:07.31

BTW, I did something similar [to the mod that follows] but MUCH easier... No soldering, removing antennas, PCBs, etc..

Just open up the Pro 43 and look down on the bottom PCB from where the batteries usually lie. You'll see the diodes there. Simply take an xacto knife and and break the solder on the D4 diode (left-most on mine) on the side facing you. I just cut back-and-forth for a bit. Once the solder (it's surface mounted) is weak enough, I just bend up the diode a bit from the PCB. Presto. I left mine hanging on the one side with solder. If you continue to work it a bit, you can probably remove the whole diode.

--Ed

From: springel@umich.edu (Jason G. Springel)
Subject: MODing a Pro-43 without soldering

I just purchased a new Pro-43 to replace my Uniden 200XLT after reading many of the praises for the Pro-43 on this newsgroup. I decided to try and MOD it, but don't have a lot of experience with a soldering iron. After examining the scanner's innards, I found it was quite easy to "fix" with nothing more than a minature philips screwdriver and some small needlenose pliars.

********** Standard Discalimer from other MODs:

1-It is against the law to monitor cellular or mobile telephone calls.

*****2-Procedures outlined below [DO NOT] require knowledge of microcircuits, soldering and assembly techniques.

*****3-You will [NOT] need a low-wattage soldering iron, solder and other various tools to help in the procedure.

4-The following procedure will void your warranty.

****
Here is my new MOD:

Step 1

Remove the battery, antenna, and back cover which is held in place by four screws. Place the scanner keypad-side down on your working surface.

Step 2

Remove the six screws holding the top circuit board in place.

Step 3

Using a VERY small screwdriver (I used one from a Radio Shack kit), remove the two screws from the lower circuit board. Looking down at the unit, you will see that the screw on right side of the lower circuit board can be easily removed. Remove the screw on the left side by by sliding the screwdriver between the top circuit board and the metal frame which holds the two boards together.

Step 4

With these two screws removed, you can now lift the entire top panel (antenna, volume, and squelch knobs) along with the top two circuit boards as one unit. The two circuit boards will be connected to the final circuit board (the one attached to the front section of the scanner) by several wires. Simply set the top panel/circuit boards alongside the front section of the scanner and you can leave these wires connected.

Step 5

The microporcessor is located under the large metal shield on the final board (the front section of the scanner with the display and keypad). If you look under metal shield from the side closest to the bottom of the scanner, you should see the row of diodes labeled D1-D5.

Only diodes D1, D2 and D4 should be present.

Use a small pointed tool to break off D4. You actually don't have to remove it completely (unless you want to use it to restore additional frequencies as explained in other MODs), you can just lift one side so it dosen't make connection and then put a small piece of tape or heat shrink over it, so it won't. Make sure it's not lifted to high or the boards will not fit.

This will restore Cellular Frequencies in 30 kHz steps.

Step 5

Reverse the process to replace the top panel/circuit boards and the two screws that connect the lower circuit board. Replace the 6 screws from the top board. Replace the cover, etc.....

...the diode positions on the cpu board, of which only three are filled look like this. Where X equals a diode soldered in place.

D5 D4 D3 D2 D1

O X O X X Normal configuration

O O O X X Cellular modification(D4 removed)

O O X X X Lo-Band modification(D4 in D3's place)

These directions were based on an original MOD design whose origins I do not know. My thanks go out to the original author of that MOD! Hope this helps those of you who do not own a soldering iron!

From: ross@novax.llnl.gov
Date: 19 Aug 92 16:51:08 GMT

Here is my keypad beep delete mod for the RPO-43:

1. Remove battery.
2. Remove back cover (4 screws).

3. Remove top board (6 screws, desolder two antenna connections and bend antenna ground lead up out of the way). Be careful of black connector at bottom of board. Flip board over and lay aside (wire connectors need not be disconnected).
4. Remove middle board (remove 2 screws and wire connector). Be careful of two multi-pin connectors along underside of board. Set middle board aside.
5. Locate 10 pin connector on side of bottom board (labeled CN3). Note that one end of connector has pin 10 labeled as such. Count back to pin 6 and bend pin 6 ninety degrees towards the large RF shield. Make sure the bent pin clears the RF shield.
6. Reassemble and your done OR do the cell mod since you are so close.

Have fun. Gary Ross >usual disclaimer>

Subject: Improved audio for the PRO-43 portable scanner
From: parnass@cbnewse.cb.att.com (Bob Parnass, AJ9S)
Date: Wed, 2 Dec 1992 01:15:35 GMT

IMPROVED AUDIO FOR THE PRO-43 SCANNER

by Bob Parnass, AJ9S

The Radio Shack PRO-43 scanner audio is too bassy.1 The lack of treble makes it difficult to hear the PRO-43 in noisy situations, especially while listening in a car or truck. Louis Shirley sent me a schematic and suggested I remove C341, a tiny 0.015 ufd surface mount capacitor.

I'm glad to report that removing C341 made a great improvement. The audio is now much "crisper," more like the Uniden 200xlt, although still not quite as loud. Turning the volume control up still overloads the PRO-43's small, internal speaker, but there's less need to do that once C341 is removed.

The PRO-43 contains 3 printed circuit boards, and the middle (second) board contains the audio circuitry. Finding C341 is difficult, as it is neither marked with a value nor a component designation. It is located on the foil side of the middle board, under IC304, an LM386 amplifier IC. C341 is in parallel with, and physically next to, R350 (33,000 ohm). R350 is slightly larger than C341 and is marked 333. Both R350 and C341 are connected between pin 2 of the LM386 and ground.

A Note About 50-88 MHz Reception

Now that I have a schematic, I see that the European version of the PRO-43 has different coils and capacitors in the low (mid) band front end filter. That explains why the 75 MHz sensitivity isn't stellar after adding diode D3 to enable 30-88 MHz coverage.

---

Subject: S-Meter for PRO-43
From: schuster@panix.com (Michael Schuster)

Found this on the Fidonet scanner echo:

=====begin quoted text=================

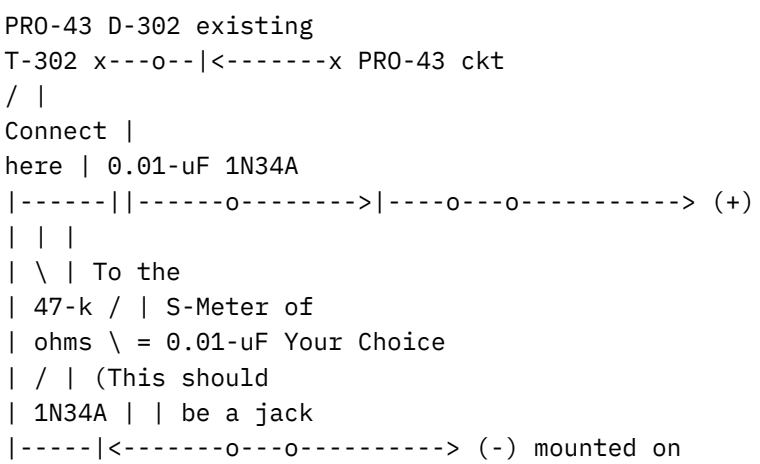
Date: 02-06-93 00:24
From: Bill Cheek
To: All
Subject: PRO-43 S-Meter!

Greetings Scanner Fans!

It had to happen! The fundamentals for an S-Meter exist alive and well in the PRO-43! Only a simple circuit and your choice of meter, analog or LED, is required for a jim-dandy S-Meter function!

The key point in the circuit is the cathode of D-302 located on the bottom (solder side) of the AF Board (middle board). You will need the Service Manual for the PRO-43 to find it as it's not marked and it would take me 10,000 words to guide you to exactly where it is located. Call Tandy National Parts at (800) 442-2425 to order your manual: approx $10. Now here is the deal:

Locate D-302 and either build the following circuit right there on the back of the AF board in the vicinity of D-302, or solder a wire to the cathode of D-302 and route it to somewhere else more convenient to feed the below circuit. This wire ought not to be very long, though, say not more than a couple of inches. Refer to the ASCII schematic diagram as follows:



^ PRO-43 Ground^ the case of
Legend: the scanner.
|
1. ---||--- and = are 0.01-uF capacitors; disk, mylar, monolythic, chip
|

2. --->|--- and ---|<---- are germanium diodes, 1N34A
| is cathode
< is anode

3. o means a connection, preferably soldered

4. The 47-k resistor is self-explanatory, I hope.

5. -------- and | are wires/conductors.
|
|

6. x is existing PRO-43 circuitry

If you use an analog meter, preferably a real S-Meter like salvaged from an old junked CB rig, then rig it as follows to connect to the circuit above:

```
5-k Trim Pot
(+) --------/\/\/\/\---o--------|
| | |
This should |-------| |
be a plug of +
some sort to The S-Meter
connect to the Terminals
mating jack on -
the scanner |
|
(-)----------------------------|
```

You can also build the 10-segment LED S-Meter as shown in Volume 2 of my SCANNER MODIFICATION HANDBOOK, available from leading mail order radio dealers everywhere. ISBN 0-939780-14-3 published by CRB Research Books, Inc. Commack, NY.

After connected and working, locate the PRO-43 very near a known strong transmitter, perhaps a ham transmitter, a police cruiser, your favorite security guard's handheld or right next to a cordless telephone, or anything else known to transmit a strong signal. Tune the scanner to the frequency, and adjust the 5-k trim pot above so the meter reads exactly full scale. All other signals will read proportionally lower to yield "relative signal strength" measurements! A hell of a circuit here, boys & girls! Have fun!

Developed & distributed by: Bill Cheek
COMMtronics Engineering

From: bbb@kuhub.cc.ukans.edu (LORD BB)
Subject: PRO-43 w/400 CHANNELS HERES HOW!

IT IS NOT FOR THE FAINT OF HEART however.

PRO-43 ENHANCEMENT
MEMORY EXPANSION & "FADE-AWAY" LIGHT
Brett Bennett 4/12/94
bbb@kuhub.cc.ukans.edu
Copyright 1994 B&D Electronics All Rights Reserved

INTRODUCTION

The following document details two enhancement modifications that are possible on the Radio Shack PRO-43 scanning radio. The first modification doubles the factory standard memory capacity, allowing you to enjoy an additional 200 channels of memory, plus 10 more monitor memories. After completing the first modification, it is a fairly simple matter to add a 7 to 10 second delay feature to the LCD back-light lamp circuit. I designed and performed these modifications on my PRO-43 and they do work. As I understand it, there (has been/is being) presented in WORLD SCANNER REPORT a similar memory expansion. I have not seen this modification and for all I know it is a better way of doing it. What is presented is a 'clean-room' design of my own that to the best of my knowledge is the only one to also offer a time-delay for the LCD back-light. Having said that, let me say:

I ASSUME NO RESPONSIBILITY FOR ANYTHING THAT MIGHT HAPPEN TO YOUR RADIO SHOULD YOU OR ANYONE ELSE ATTEMPT THESE MODIFICATIONS. WHILE REASONABLE CARE HAS GONE INTO THE PREPARATION OF THE FOLLOWING DOCUMENT, I CAN NOT GUARANTEE THAT THERE ARE NOT ERRORS.

The procedure described below is very complicated, and involves the soldering and desoldering of very tiny components and the cutting of printed circuit board traces. While the procedure is not irreversible, it will leave permanent scars inside your scanner. It should only be attempted by someone with moderate to advanced electronics experience. I don't think it should be attempted by, to quote someone else, a "weekend technician." If as you read through this you feel intimidated by the jargon and required procedures or if an electronic schematic looks like a strange piece of modern art to you, then this might not be the 'mod' you are looking for. The following document will assume you have obtained the materials listed below, especially the Service Manual, and you have studied the circuit in some detail. I will not describe

in great detail where every component is or where every solder point on the logic board should be placed. Having the Service Manual, and having studied the drawings therein will allow you determine to where it is I refer.

REQUIREMENTS

1 - PRO-43 Service Manual. (Tandy Parts # MS-2000300 - approx. $6.00)
1 - CD4053 - Triple - SPDT analog switch - Surface mount package (DigiKey #CD4053BCM-ND - approx. $1.50)
2 - 93C67 EEPROMs (Tandy Parts # MX-8050 - approx. $13.00/each)
1 - 100k x 5 resistor network. Common lead type. (DigiKey # Q5104)
1 - UN2111 PNP transistor (Q1 on Logic PCB. Tandy Parts #)
1 - 1 uF 16v capacitor.
1 - 10 MOhm 1/8-1/16W resistor.
Misc.:
Wire wrap wire-30 gauge. (Radio Shack)
Grounded soldering iron with approx. 1/32" tip or smaller.
Desoldering Equipment.
Digital Volt Meter. (Used to double check your VCC and Ground connections, pre-check switching assembly)
Utility knife with fresh sharp small blade. (Needed to cut traces.)
Strong hand held magnifying lens. (Needed to check solder joints.)
+5-10 Volt bench power supply. (Used to check switching assembly.)
Anti-Static work place and grounding wrist band.
Very fine needle nose pliers, wire cutters.

The few alfa-numeric scanner that I know of are
1, Uniden MR-8100, made for public safety work, need PC to program
it, I paid $200.00 used a while back, great scanner but has IMD problem
in city.
2, Uniden BC8500XLT ?? saw it in Scanner World catalog and saids it
will display alfa-numeric but never owned it or seen one.
3, Computer controlled scanners, cost.. very high,
$scanner+$interface+$PC, eg, PRO-2006+OPTO456+386PC

No, it's a ripoff. I've seen them new, unused, on clearance for $329. Get
the BC3000 instead. Same features and more, plus improved performance.
They can be found for $369 - $449.

Andy

Source record: 260309

Hello to all: I just thought I would try and explain to you that there is no such thing a No-Code at least the FCC don't call it that as of right now. The Novive class for years have had CW privileges on the HF band. 80, 40, 15, 10 meters. in the last past 5 to 6 years they have had the privilege of voice on 10 meters 28.300 to 28.500 MHz. Novice also have privilegs on 1.25m and 23cm
---
A technician class is actually split two ways.
1. technician without code can only work 50 MHz and higher. (no low band)
2. technician with code has the HF novice privileges plus all the frequencies above 50 MHz.

You can find all this a more on prairienet.org, and I have been adding files more and more each week. At the prompt just type go ham and that will take you to many different files relating to amateur radio, scanner info, short wave listening, plus more. And I have a list of the states that can and cannot have scanners in their vehicles. (that means any type of a receiver capable of receiving law enforcement type frequencies on DC power.)

Amateur Radio operators are exempt in most states because amateur radio plays a big part in disasters of all sorts.

If you have any questions that I might be able to answer please E-mail me direct because I don't read this area to often.

Some suggestions:
AOR AR3000A (about $1000)
ICOM IC7100 (about $1100)
Bearcat BC9000XLT (a little under $400?)

: Hello to all: I just thought I would try and explain to you that
: there is no such thing a No-Code at least the FCC don't call it
: that as of right now.

: A technician class is actually split two ways.
: 1. technician without code can only work 50 MHz and higher.
: (no low band)
Sounds like "no-code" to me.

: 2. technician with code has the HF novice privileges plus all
: the frequencies above 50 MHz.

: Amateur Radio operators are exempt in most states because amateur
: radio plays a big part in disasters of all sorts.

Actually, it's because
Federal law takes precedence over State law. The
states have to be very careful about passing laws that would interfere
with the federally established amateur radio service.

No. Dayton is a very large hamfest, probably the largest in the world.
However, prices are always top-dollar. I guess sellers figure that if
buyers came all the way to Dayton, they *really* want to buy. Go, enjoy,
have a good time, but don't expect to find any bargains.

Another thing that has always mystified me about Dayton (aside from the
fact that it almost always rains) is that about every third table is full
of old commercial HTs, at preposterously high prices. I guess some folks
still fool around with those things, but I sure don't get it. I once asked
a friend who had just spent around $600 for a 10 channel commercial HT
(for which he did *not* have a programmer) why he hadn't bought a ham HT,
which would be fully synthasized, with lots of neat features, and cost
about half that much. He said he wanted the commercial unit because
"...you can drive a truck over it and it will still work". I'm sure that's
true, but just how often does that sort of think come up? I've been a ham
for over 30 years, and I've never once felt the need to drive a truck over
my HT :-) Anyway, if you go to Dayton, expect to see tons and tons of old
commercial HTs.

Hi there.

I'd just quickly like to ask the collective intelligence here if there is a FAQ on scanners anywhere (FTP site etc...) and if so, where I might get hold of it. Also, for anyone in the UK, any information about interesting frequencies nationally or within the Cambridge area would be greatly appreciated.

Cheers.

Si.

Fine in theory, except not true in Massachusetts, and the troopers
have heard about the "bear tracker" and turn off their MREs (meals, ready
to eat?) when not using them.

So, yes, the Uniden "pre-tuned for all 50 states" bear-tracker has been
pretty much discredited as various states have changed frequencies, and
disabled in-car relay systems. They have also been showing up discounted
in Damart and DAK catalogs, a sure sign of a loser product :-)

:

This is true. You can however, change the delay time between 0 and
9 seconds, independently for both scan and search modes. I would
have liked to seen individual channel delay, but so far I have not
found it a problem is delay is set to all channels. I have set
mine to 1.5 seconds (default is 2.0)

A good alphanumeric scanner is available from AOR, called the
AR8000, a handheld. 1000 channels, 100kHz to 1950MHz, all mode.
About $640 US.

TR> After scanning the traffic on this newsgroup it's clear that most
TR> people have mobile scanners, why ? Most seem to scan the same stuff I
TR> do police EMS etc... I understand some people carry their units with
TR> them to races and events. Does a mobil unit have a advantage over a
TR> base that I don't know about ?

TR> I have a model 2030 RS base, it seems like a good scanner for the
TR> price 150.00. I don't ever here the 2030 mentioned here :-(

Hi, Tim...I never noticed that more people had more portables than base scanners until you mentioned it. I use my portable more than the base because I am out and about quite a bit. I believe most people start out with a handheld unit and then get a base second.

A handheld, in general, isn't any more better or worse in performance than a base. The circuitry is pretty much the same. Obviously, with a base, you may get more bells and whistles, the ability to use house power instead of the batteries on a handheld, better reading of the display and the ability to connect to an outside antenna to bring in the signals.

While the 2030 isn't the top of the line, it is good for someone getting started into the hobby. I tried one out a couple of years ago before giving it away as a gift. Nice little unit. And, because it is powered with a wall adapter, you can leave the adapter at home and bring it with you in the car. (BE CAREFUL OF POLARITY).

Rd> Anyone know where to tune for the Shuttle in the Boston area

I don't...but you might be able to find an amatuer radio repeater in the
area that simulcasts such broadcasts. Check between 144 and 148 Mhz and
440 to 450 Mhz.

Ch> The 2-9-1/o trick is quite cute. Does anyone by chance
Ch> know of any mods/tricks for the PRO-34?

Ch> Bought it down in North Carolina 4'90.

Hi, Chris...I used to have the '34. Nice little unit if you could stand cellular in the 800 Mhz public service band. There were never any tricks that you could do on this unit. There is a mod for continuous 800 Mhz coverage.

Product: Realistic PRO-34
Purpose: Restore continuous 800 Mhz coverage

** Disclaimer...Doing this procedure is done at your own risk. This procedure is fairly complicated and should not be attempted by anyone unfamiliar with soldering small circuit boards. **

** Warning...Performing this modification restores certain portions of the 800 Mhz band that is prohibited by U.S. federal law to monitor. **

The following procedure is from the December, 1988 issue of Monitoring Times, page 89.

1. Remove the battery cover and battery, four black screws from the rear cover, and volume and squelch knobs.

2. Remove the rear cover, lifting back and upwards to clear the control shafts (do not remove belt clip or circuit board screws.)

3. Unplug the brown volume control connector (green, yellow, black cable) and white squelch cable connector (white, black, red cable) from the linear circuit board.

4. Unsolder the ground lead from T111 (at the corner of the linear circuit board above the external power connectors). (My note- my particular unit didn't have this connection. This may be true of other units.) Unsolder the two power switch leads from the back of the volume control. Unsolder the antenna connector center pin and ground leads from the linear circuit board.

5. Unscre the four combination screws that hold the linear circuit board and held the rear cover screws. Grasp the linear circuit board at the top and lift it straight away from the front case, unplugging the 16 pin connector.

6. Remove the three screws holding the metal frame assembly which held the linear circuit board to the front panel. Unplug the red-black power lead and lay the frame aside (it is still connected to the battery contacts).

7. Locate diodes D9-D12 on the volume control side of the logic circuit board under T1; D10 and D11 are marked. Clip one lead of D11, separating the gap slightly (it may be resoldered later if desired).

8. Re-assemble the board by reversing the disassembly procedure.

For information...D9 enables 66-88 Mhz, though re-alignment is required and 30-54 Mhz band is lost. D10 enables 896.1125-960 Mhz and is already installed. D12 disables 136-146 Mhz. I found on my unit, which was older, D12 changed the stepping of 12.5 Khz on certain portions of the band where 30 khz would be the default.

Source record: 260139

Just recently, the Stanford Police have been switching to Channel 4 to discuss things. They used to use Channel 3 (483.3375) for this.

Does anyone know what the frequency for this new channel is?

Channel 1 is 482.6125.
Channel 2 is 482.8125.

I have tried the other Stanford affiliated frequencies in the 480 MHz range and found nothing.

I have been listening to air com. especially from Denver Airport
in around 20 frequencies; hottest are 128.325, 133.175, 126.500 etc.
However, I am only able to receive one side of conversation, usually the
pilot. I use PRO-39 with its built in antenna. Do I need to use the
outdoor antenna to receive both side of conversation?
My location is around 200 miles(?) north of Denver, in Laramie,
Wyoming. Any response would be appreciated. BTW, we can also exchange
some of the frequencies. I know this news-group has some wonderful
people. Please post or send the private mail.

3272. How police radar works???

Newsgroup: rec.radio.scanner
Date: 1995-03-14 20:07:04 UTC
From: mudaw@uxa.ecn.bgu.edu
Message-ID: <3k4t18$qms@ecom2.ecn.bgu.edu>
Source record: 260134

Is police radar based on dopplar shift,
or on a reflected signal time interval?
Dopplar shift seems theoritically possible, but I don't know how
the equipment could be sensitive enough.
I am guessing the method is based on a reflected signal,
but I haven't read anything on the subject.

Any ideas/comments/info?
Thanks,
Dave

Michael Cole (Michael_Cole@hp6650.desk.hp.com) wrote:
: Does anyone have the memory reset key sequence for the Bearcat 200LXT?

I don't know how to totally wipe out all of the memory, escept for individually deleting the freqs as you go. Otherwise, remove the battery and leave it disconnected for 3 days. :-)

> In addition, does anyone know of a way to instantly remove all channel
>lockouts at once for this same radio? I've seen reference to
>this undocumented feature on other scanners and
>was wondering if it also would work for the Bearcat. Thanks for any
>info. you can provide!

this *IS* documented in the book that comes with the scanner:

press and *HOLD* the L/O (lockout) button until you hear the
TWO-BEEP confirmation. (just like the keyboard lock button works).

Important note: this only erases the lockout on all of the *SELECTED*
channel banks.

Thus, to wipe out all lockouts, go into scan mode, enable ALL banks,
then hit lockout, and hold it until you hear two beeps.

If it's actually a birdie (a signal generated by the receiver itself), you can't, unless you are very lucky, and know where the signal is actually coming from, and can re-design the unit to eliminate the signal. Sometimes this is as simple as moving a wire. Most often it's not (if it were, the manufacturer would have done it).
If the signal is present no matter what you do (remove the antenna, turn squelch all the way up, drive 100 miles away), then it's a true birdie. It may be, however, another transmission mixing with your IF (image). In that case, a different antenna may help.

Almost, but no cigar...
Ham operators are exempt in ALL states from bans on having HAM equipment
that's capable of receiving law enforcement frequencies, because it's
federal law (recently strongly interpreted that way by the FCC).
This does not address scanners in any way; states & localities can still ban
their use in vehicles.

here's a short blurb on what I think of the BCT-7 scanner from Uniden after having one for a while. someone I replied to recommended I post it.

the good stuff:
- the audio is great and plenty loud for mobile use
- bright, clear backlit display
- everything is preprogrammed and there are 100 additional frequencies you can program yourself
- it has CB frequencies for listening, which I find amusing on occasion to listen to. can be good for road info.
- weather scan
- air search
- decent squelch
- lockouts in searchs & scans (up to 100 channels)
- fast scanning
- nice size
- highway patrol extender warning can be muted

the bad stuff:
- annoying, non defeatable start up beeps (ala radar detectors)
- searching is limited to huge ranges, you can't redefine them at all. a pain.
- you can only program your private frequencies by walking through those ranges. ack.
- no numeric keypad!
- intermod problems (I think it's only a double conversion unit)
- can't defeat the priority hwy patrol scan so there are pauses when listening to police/DOT (well, you *can* defeat it by locking out the priority channels)
- the way the 100 private frequenices are handled is weird. they are portioned out among the scan bands (hwy. patrol, fire, news, police, DOT, private etc.). this means if you have a favorite ham channel you like to monitor, you have to waste like 4 memories becuase you have to program it into each private memory area of each scan bank! stupid! I don't understand this.
- Before I bought it, I thought you could "add-in" different scan banks to the mix and eventually scan all different band plans (including your private frequencies). nope, can't do that. you can only scan one of these at a time:
highway patrol + its private channels
highway patrol/police + their private channels
highway patrol/DOT + their private channels
fire + its private channels
news + its private channels
weather
private channels NOT assoicated with the ones above. again, silly IMHO.
- weenie antenna
- upgradeable for state frequency changes???? unknown.

even with all the quirks I decided to keep mine since it is useful for a mobile unit and is a product headed in the right direction. I think the feature set was desgined by one of the leading scanner frequency books staff, I don't remember who.

When you think that its INTENDED for truckers who don't want to fuss a lot, the design makes more sense. it's a huge hit in that market too. Apparently becoming more recommended then a radar detector.

With this and the 9000XLT, Uniden is slowly getting it's act together.

The codes are often dependant on where you live. Here in Colorado, we use a variety of codes. Where I work, we use a system called the ten code (not the 10 codes, it is very confusing) but they are as follows:

Code-1 Traffic hazzard
Code-2 Traffic Stop
Code-3 Emergency Traffic Only
Code-4 Everything is OK
Code-5 Prisoner
Code-6 Crazy Person
Code-7 Meal Break
Code-8 Arrival
Code-9 Arrest Warrant
Code-10 Officer Needs Assistance / Officer Down

Hope that may help you

In <J+7YVXa.orkin@delphi.com> orkin@delphi.com writes:

>Why dont the celluar companies just scramble so they dont have to worry
>about anyone haering them?

Well the biggest reason is law enforcement. Yes, the phone companies would have to got digital. But there was also a bill just passed that stated the law enforcement must have access to all communications. its hasnt been tested in the courts and I dont think anybody knows what it means yet. But if an encryption system prevented law enforcement from doing surveilance, it would be illegal.

Case in point .... software. How secure is the password protection in Word for windows or quicken? For any commercial program? Its garbage, simply put if MS developed tough encryption they would not be allowed to export. Not to mention that the FEDs talked to Lotus when it was developing Lotus Notes. They were afraid that it was too hard to break and that criminals would use it. Software publishers can make tougher encryption, but they wont because of the goverment. I have no doubt that a company releasing an un-crackable communication device would quickly be be visted by the FBI, NSA, CIA or some other federal agency and persuaded to give out back doors, ect anything that would help law enforcement.

There is alot more of this on "alt.security.pgp" and "sci.cryptology", but basically law enforcemnet does not want average citizens to use encryption systems. Atleast ones they cant break. There is a big fear that programs like PGP are getting so secure that there is a bill floating around to ban all encryption that the goverment can not crack.

This got long but it answers one of the reason we do not have encrypted phones. Atleast a very big part of it!!!

-Rich

BTW:) Keep this in mind when the goverment trys to pass the bill against encryption it may actually be voted on.

Any thing that can be coded can be uncoded. The Corba uses aone
type of encription. With about 50 bucks and two hours you can buy
and build a decoder. If there not sold in Monitoring Times there
sold in National Scanning.

So Go land line or be monitored! (not by me...)

Cop tax radar uses Doppler shift, all bands.

3313. Radar Jammers-Legal?

Newsgroup: rec.radio.scanner
Date: 1995-03-15 05:34:48 UTC
From: brian varine <varine@ece.orst.edu>

I've seen a few ad's for active radar jammers and the comapanies claim that they are legal since they put out a really small signal >10mW. The claim the FCC reg's somehow do not cover transmitters with very low output. They've told me that as of now they know of no law (they assured me that they have done research) that makes them illegal. I'm a little skeptical but the idea sounds great. Do these X-mitters get by under the same regs that allow those FM trasmitters to be sold (like wireless speakers and things like that). What law would make them illegal?

>doing surveilance, it would be illegal.

That is complete garbage. CMTs have been in existence for over
10 years now, yet you mention a law "just passed" to support your claim?!

There are encryption systems available, most just offering a low to
moderate degree of transmission security, and some areas have
implemented secure cellular systems for government use -- certified for
Top Secret.

The cellular industry simply didn't want to spend the time or $$
developing encryption algorithms for the original cellular network.
Initially, they lied to the media & public by indicating that cellular
system dynamics would make it difficult for an eavesdropper to listen in
(in the mid-1980s, I was told that my cellular phone would start beeping
if someone, "somehow" was listening in. It was a cellular sales guy that
told me this). As more & more stories came out in the media about people
entertaining themselves (as well as those with malicious intent) buy
spending about $200 for a scanner radio that could tune in cellular, the
industry changed their lie to indicate that the average call hopped (&
thus, changed freqs) every 10 seconds or so, so that people with scanners
were only hearing brief bits of any one conversation.

As of late, it seems like the industry has given up trying to
spew misinformation/disinformation, & now say that the majority of the
CMT users aren't concerned about the vulnerability of interception, & for
those that are, encryption systems are available (they still don't
advertise the crypto systems much, because it would be a Catch-22 situation).

As more areas start to phase-in the TDMA & CDMA digital systems,
the cellular industry will use the privacy issue as one way to start
steering people over to the digital standards.

The government certainly has an interest (whether or not it is 'legitimate' shouldn't be argued in this newsgroup) in encryption systems available to the public, and that includes any cellular systems (the National Security Telecommunications Advisory Committee has had an involvement in the TDMA & CDMA standardization process), but it is stupid & just plain wrong to allude that there aren't cellular encryption products available to the public, and that it is the result of the government.

: says...
: >
: >Anyone familiar with the beartracker from Uniden?

: The freq it uses to trigger the alert light is used by the mobile
: extender (a mini-repeater used only between the patrol car and the
: officer's portable radio).

: Two very important things the Beartracker ads don't tell you:

: 1. The mobile extender is on ONLY when the officer is OUT OF THE CAR.
: Therefore, (A) if he's sitting in his car watching the readout on his
: radar unit as you came barrel-assing over the hill, the mobile extender
: is not on and the Beartracker ain't gonna save your ass no way, no how,
: (B) if he's out of his car using his portable it means he's busy with
: something/someone else and probably not interested in you, anyway.

: 2. Not all states have mobile extenders in their patrol
cars.

I knew that there was something more to it than that. They were
advertising it to be a "radar-detector" of sorts for the police radio,
and knew that through the use of repeaters nowadays, there was no miracle
way to detect where the source of the signal is originating, unless it
was tuned to the repeaters input freq. that the cops radio was xmitting
on.

You have THE police 10-codes and want some other codes?

First of all, there is no police 10-code...there are dozens of
them! Each department can invent their own code, and many do.
When I was with one department, a department that shared a border
with us used a totally different 10-code. Those of us who had been
around awhile eventually learned some of their codes and they ours,
but for the most part, we had to talk to each on the radio in plain
English, because a 10-99 for them wasn't the same as a 10-99 for us.

radio codes weren't developed to keep scanner listeners from
knowing what's happening...they were developed to keep communica-
tions as brief as possible. It's much simpler to ask for a "27"
or "10-27" than to ask for "license registration information."

>but I haven't read anything on the subject.
>

As far as I know they work on time interval.(if the cop car is stationary) Radar signals (Rf) travels at a constant speed of of 1 mile in 6.18 microseconds. So the circuitry in the gun starts a timing circuit when the gun fires and times the length until the pulse returns. This would be for a unit that was not in motion, cop parked.

For a car in motion the gun sends out 2 pulses, one a little off to the side of the car to bounce of a stationary object on the side of the road to tell the gun how fast the cop car is moving thus determining the doppler shift caused by the cop car movement. Then the second pulse bounces off the target car and that doppler shift and the one from the cop car are mathmatically figured to determine the target car speed.

Just what I have found out in my 7 years of being a radar tech. Which has come in handy in beating a radar ticket in court! The cops know how the gun works, Radar techs, know how and why so WE are the experts in this area. Your tax dollars hard at work! Strange that now I going to be a cop. Oh well.

Technically he is right, but it is a minor point. The "official" names of the licenses are "Technician" (this is the one where you don't take a code test), and "Technician Plus" (this is the one where you do take the code test). There is no license that is officially known as "No-code Tech(nician)", "Tech Lite", or half a dozen various other slang names for what officially is called "Technician".

Well, not quite on this one either folks. The FCC did issue an order that says hams are exempt from all state and local scanner laws, but only for ham transceivers that also receive public service frequencies. It does not apply to scanners, and both the FCC and the ARRL have stated this several times. And before anyone asks, no, a handy-talkie attached to the top of a scanner with duct tape does not make the scanner a transceiver. Also, the FCC did not pass this ruling until late 1993 or so. The last states that did not exempt hams changed their laws in 1992, so for all intents the FCC ruling has no effect at the state level (and before the trivia buffs ask, the last two states with scanner laws that forbid mobile operation of scanners to exempt hams were Kentucky and New Jersey, and both were changed in 1992).

As someone else stated before, the main reason states changed their laws, and the reason the FCC issued its ruling, was because almost all 2 meter radios sold also have the capability of monitoring public service frequencies in the VHF range (the only one I can think of off hand that won't is the Radio Shack

HTX-202). Until the laws were changed, this technically made most ham operators into violators if they had a 2 meter ham radio inside their car. And even after the states with scanner laws changed theirs, there are still a number of cities and counties that have scanner ordinances on the books, hence the need for the FCC ruling.

character in the right margin.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in |
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA. It
tells where you can buy your first scanner, what features
it should have, where to get it repaired if required, how
to get frequency information, and mentions a few scanner
clubs worth joining. |

The author writes a monthly "Scanner Equipment" column for |
Monitoring Times magazine, published by Grove Enterprises, |
but views expressed in this article are his own.

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, armored cars, trains, taxis,
airplanes, and buses are all equipped with radios and you
can listen to them. You can monitor the local sheriff and
fire departments to hear about events "as they happen,"
before the news reporters hear about them. Hostage dramas,
bank robberies, car crashes, chemical spills, tornado
sightings are all fair game. In a single afternoon, you
can hear a high speed police chase, Drug Enforcement agents
on a sting operation, and undercover FBI agents as they
stakeout a suspect.

How about listening to a presidential candidate discuss
strategy with his advisor from a 415 MHz radiophone in Air
Force 1, or a team of G-men protect him while transmitting
in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you
can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots.

Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

You can even listen to the order taker's wireless microphone at the local McDonald's restaurant on 154.6 and 35.02 MHz!

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. A new law outlaws listening to cordless phones, too, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the laws.

It is now illegal for companies to sell recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a 39 page paperback, ANARC Guide to U. S. Monitoring Laws, compiled by Frank Terranella, available for $9.95 + shipping from Grove Enterprises, PO Box 98, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners bear the Realistic label but are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000

have good reputations.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 40 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often poor.

Deluxe scanners can be controlled by a personal computer, although this feature isn't important to many scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are undesireable due to the interference they cause, e.g.,

hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces image reception.

Currently, the more popular scanners include the Uniden/Bearcat BC760XLT (a/k/a 950XLT) and discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, and Radio Shack PRO-43 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The new Uniden replacement models, the BC9000XLT and BC3000XLT, work very well and are my current favorites.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 has recently been replaced by the 1000 channel PRO-2035. The portable Radio Shack PRO-62 is a good performer. All three models employ up conversion and are made for Radio Shack by GRE (General Research Electronics). Both GRE and Uniden make scanners for Radio Shack.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a spring shaped antenna, covered by rubber. Although it is small and tolerant of physical abuse, the range of a heliflex antenna is very limited. Augmenting it with a 19" telescoping metal antenna can improve portable reception greatly.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to lightning strikes because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because it they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Wal-Mart, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200. Telephone (orders only): (800)438-8155.

- National Tower Company, PO Box 15417, Shawnee Mission, KS 66215. Telephone (913)888-8864.

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Marymac Distributing (Katy, TX) sells Radio Shack scanners at discount, but charges a 20% restocking fee for returned merchandise. Telephone (800)231-3680 and (713)392-0747.

- Scanner World (Albany, NY). Telephone (518)436-9606.

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Many ham radio dealers, like Amateur Electronics Supply (Milwaukee, WI, (800)558-0411), also sell scanners.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

If you are handy with a soldering iron, you may be interested in modifying your scanner to add features or enhance its performance. Be warned this usually voids your warranty. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

ftp.cs.buffalo.edu
garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and stocks parts for several older models. G & G sometimes buys old scanners, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $25. A new 3rd edition is expected in early 1995. Monitor America contains several pages of police, fire, local government,

news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's 168 page Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 9th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and Kneitel's sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. It will likely disappoint experienced scanner hobbyists and is better suited for beginners. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the

US. It works well.

Grove enterprises sells FCC license information on CDROM for $100. The fields are similar to PerCon's Spectrum CDROM, but the transmitter and licensee location are intermixed which makes query results confusing. The first release has problems with mistakes in the data and documentation, and I look forward to a new release to correct these shortcomings.

Over 15% of the FCC licenses, including many fast food restaurants, contain transmitter latitude and longitude but specify no transmitter city. To determine the location of those transmitters requires using the latitude and longitude information.

As I have already done for dozens of radio enthusiasts and companies in several states, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, and produce a custom report. To make it easy to locate transmitters, the report includes an 8-1/2" by 11" scaled | plot marked with transmitter sites and cities (no streets). I call this innovation RadioMap(TM) service.

It allows you to identify antenna sites (including paging and cellular phone cell sites) and visualize the transmitter locations in your neighborhood, near your office, at an airport, and other places of interest -- from VLF through microwave. Industry uses RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites.

This is completely different from, and independent of the Grove Enterprises CDROM.

Ham radio stations are not listed. The RadioMap report includes frequencies, callsigns, and licensee names. For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density. A 5 mile range (100 sq. mi. area) works well in most suburban areas. In rural areas, ranges of up to 10 or more miles (400 sq. mi. area) are possible, while ranges of 1 to 2 miles produce best results in urban cities, e.g., Manhattan and downtown Chicago.

I will produce custom RadioMap reports for areas in any of the 50 states. Send $19.95 (check or money order) for each RadioMap report, your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM central time.

Price increases to $25.95 on April 1, 1995.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio users to identify their operations with their assigned call letters, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person

could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are

several regional chapters which hold regular meetings. Club dues are $24.00 per year, which includes the monthly RCMA Journal, which consists of approximately 95 pages. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

AOSC questions can also be sent electronically to:

rccons!aosc_hq@telerama.pgh.pa.us or
dave.marshall@f240.n108.z1.fidonet.org.
FidoNet: 1:108/240.0

AOSC also has a MEMBERS & EDITORS Scanner related echo, AOSCNet, distributed via FTN on 6 BBS systems, and via Internet Mailing list. For info on the ECHO only, contact:

R.E. Christian, AOSC PA/AOSCNet Founder
PO BOX 12763,
Pittsburgh PA 15241-0763.
FAX: 412-831-5860.

Internet: rccons!aosc_pa@telerama.pgh.pa.us
rccons!aoscnet_hq@telerama.pgh.pa.us
rick.christian@f220.n129.z1.fidonet.org
FidoNet: 1:129/220.0

To receive a file of info on the All Ohio Scanner Club via Internet send to: rccons!ftpmail@telerama.pgh.pa.us

In body: get aoscinfo.zip

This will send a UUENCODED info packet to you. The file contains an outline of the material you will find in the American Scannergram, the AOSCNet, and an application for membership. (Note: This file will not be sent back to *.fidonet.org addresses.)

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, most at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $15 check, payable to Kim Moran, to:

The Command Post
attn. Kim & Ted Moran
6143 W. Touhy Avenue
Chicago, IL 60646

Some CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (708)852-1292.

Here is a tentative meeting schedule for 1995. All meetings will be held on Saturdays at locations announced in advance.

February 18, 1995 - Westmont Police Dept.
April 15
June 17
August 19
October 14
December 16

Bring a notebook and your appetite.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

I am often asked, "How do you find these frequencies?"
Scanner enthusiasts can obtain frequency information from
several sources, including books, government microfiche
records, or other listeners.

Books

The most convenient source of fire and police frequencies
is the Police Call Radio Guide, published each year in 9
regional volumes by Hollins Radio Data, and sold at Radio
Shack and larger book stores for under $10. Police Call is
basically a computer printout of FCC license information in
the fire, police, local government, and conservation
services in two lists: by licensee name within state, and
by frequency. Later editions have included a few pages of
local airport and nonsensitive federal government
frequencies.

I highly recommend Richard Barnett's 1992 book, Monitor
America, published by Scanner Master Corp., and available
from Grove Enterprises for about $25. This second edition
is crammed full of police, fire, local government, news
media, sports, national park, and commercial broadcast
frequencies for all 50 states. The information was
compiled mainly from members of the world's largest
scanning club, the Radio Communications Monitoring
Association (RCMA). Monitor America contains detailed
communications system profiles and precinct maps for major
metropolitan areas. Police and fire radio codes and unit
identifiers unique to local agencies are listed for several
cities. This differs from Police Call, which gives a more
sterile, but uniform treatment of licensees, listing even

the smallest of towns. A 3rd edition is expected in early 1995.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Beyond Police Call, available from several sources including Radio Shack, covers the business, schools, and other stations not covered by Police Call, its sister publication. One volume covers the entire USA, but no call signs are shown.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The second edition is about 400 pages and is available from Official Scanner Guide. The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $100 instead. The fields are similar to PerCon's Spectrum CDROM (see below), but the transmitter and licensee location are intermixed which makes query results confusing. The first release has problems with mistakes in the data and documentation, and I look forward to a new release to correct these shortcomings.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. It works well.

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

Over 15% of the FCC licenses, including many fast food restaurants, contain transmitter latitude and longitude but specify no transmitter city. To determine the location of those transmitters requires using the latitude and longitude information.

As I have already done for dozens of radio enthusiasts and companies in several states, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, and produce a custom report. To make it easy to locate transmitters, the report includes an 8-1/2" by 11" scaled | plot marked with transmitter sites and cities (no streets). I call this innovation RadioMap(TM) service.

It allows you to identify antenna sites (including paging and cellular phone cell sites) and visualize the transmitter locations in your neighborhood, near your office, at an airport, and other places of interest -- from VLF through microwave. Industry uses RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites.

This is completely different from, and independent of the Grove Enterprises CDROM.

Ham radio stations are not listed. The RadioMap report includes frequencies, callsigns, and licensee names. For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density. A 5 mile range (100 sq. mi. area) works well in most suburban areas. In rural areas, ranges of up to 10 or more miles (400 sq. mi. area) are possible, while ranges of 1 to 2 miles produce best results in urban cities, e.g., Manhattan and downtown Chicago.

I will produce custom RadioMap reports for areas in any of the 50 states. Send $19.95 (check or money order) for each RadioMap report, your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM central time.

Price increases to $25.95 on April 1, 1995.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA)1. Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'2.

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information

is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are collected annually, which covers a monthly newsletter, the RCMA Scanner Journal, about 95 pages long. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. A recent liberalization of club policy now permits the printing of most federal law enforcement frequencies, e.g., Secret Service, FBI, Customs, and DEA.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542
Silverado, CA 92676
USA

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

The real challenge is deriving new spectrum usage information. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

More about sleuthing will be discussed in Part II of this article.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?
Part 2: Sleuthing

by Bob Parnass, AJ9S

Part I of this series discussed how scanner enthusiasts can obtain frequency information from books, government microfiche records, or other listeners. This installment discusses digging up new frequencies on your own.

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters.

Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a

local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described in Part I of this article, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls.

A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

Anybody with enough money can buy a brand new scanner, but you can save lots of money if you get a good deal on a used scanner. Hamfests are probably the best place to find used radios, but you must be familiar with the equipment. Hamfests are repleat with older radios you won't see in today's catalogs.

At last count, there were over 70 scanners and monitor receivers of various brands in my collection. I purchase most of my receivers at hamfests or horsetrade with other radio hobbyists. This article describes a few of the FM receivers in my collection, and is not meant to be complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Several people have been pleased with Electronic Repair Center, in Franklin Park, IL, which repairs scanners for a flat fee. Call them at (708)455-5105 to find out their current rates. G & G Communications (telephone 716-768-8151) is another scanner repair company. This family owned company repairs scanners and stocks parts for several older models. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series. Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Bearcat BC-101, Radio Shack COMP 100, and Tennelec MCP-1, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The SBE Optiscan (and its Sears clone) required poking a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

Radio Shack scanners contain a reasonable number of features. All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. A few years ago, the Regency and Bearcat scanner lines were purchased by Uniden, a Japanese company, and production was moved to Asia.

My favorite VHF/UHF receivers are the 400 channel Radio | Shack PRO-2005 and PRO-2006, the Uniden/Bearcat BC9000XLT, and the ICOM R7000 and R7100. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer the Radio Shack PRO-43 and | Uniden/Bearcat BC3000XLT.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

ICOM

R-7000: At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the Icom user with a very annoying clickety-clack, clickety-clack!

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal

filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but has better IF filtering and contains front-end circuitry for VHF-low, VHF-high, and UHF bands. No aircraft band coverage. Three crystal filters. Front mount speaker sounds good. No rescan delay.

Bearcat 12 (Electra): One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

BC101 (Electra): First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC220 (Electra): 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC20/20 (Electra): A BC220 but with 40 channels. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies.

Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite.

BC350 (Electra): 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

800XLT (Uniden): 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal

portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels.

BC860XLT (Uniden): 100 channel table top unit. Can lock | out 10 channels during search. Good performer except for | images. |

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning | knob. 200 channels, global delay. Count, AUX, and Auto | Store features. Scans and searches fast. Accepts optional | CTCSS board. Dual conversion with 10.8 MHz first IF -- | lots of images and birdies. Prone to severe intermod, | especially when used with an outdoor antenna. |

BC9000XLT (Uniden): High quality base using up-conversion. | 500 channels in twenty banks. Tuning knob. Selectable AM, | NFM, WFM modes. Very fast scan and search. Can lock out | 50 channels during search. Delay and attenuator | independently programmable for each channel. Effective | Auto Store feature stores unique frequencies. |

BC100XLT (Uniden): Very good 100 channel portable with 10 | priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): Very good 200 channel version of | BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC2500XLT (Uniden): 400 channel portable with tuning knob. | Plagued by intermod and images. Early units drained | batteries quickly even while turned off.

BC3000XLT (Uniden): Excellent 400 channel portable. Up | conversion. Very fast scan, search, and intelligent Auto | Store. Mode, attenuator, and delay settings programmable | for each channel. |

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance

difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Radio Shack

PRO2004: Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio.

PRO2005: Radio Shack's top of the line scanner for 1989 and scanner of choice. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although there is no mobile mounting bracket available and the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended.

PRO2006: Radio Shack's 1994 top of the line scanner. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended.

PRO-2035: Radio Shack's 1995 top of the line 1000 channel | base scanner. Cumbersome 100 channel bank size. Tuning | knob. Poor dynamic range. 10 linkable search banks. Dumb | Auto Store feature stores the same frequencies over and | over. |

PRO34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO2022: Base/mobile scanner. Like the PRO2021 but includes the 800 MHz band. Cellular images throughout the 847.6 - 869 MHz range. Includes power saver circuit, odd for a base unit, which can clip the first part of a transmission.

PRO2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. | 200 channels, global delay. Scans and searches fast. | Count, AUX, and Auto Store features. Accepts optional | CTCSS board. Dual conversion with 10.8 MHz first IF -- | lots of images and birdies. Prone to severe intermod, | especially when used with an outdoor antenna. |

PRO2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers. |

PRO62: Good portable 200 channel scanner using up | conversion. Similar to PRO-43 but no military air band, | different upper frequency limit, and slightly different | IFs. Selectable AM/NFM modes. Better intermod immunity | than PRO-43. |

PRO43: Good portable 200 channel scanner using up | conversion. Covers military air band. Selectable AM/NFM | modes. Intermod in 160 - 162 MHz railroad band.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO24: Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar:

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an

optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorla Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies

-- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. The Plectron 500 series is less desireable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Parts for Plectron receivers are available from:

Some states do not care if they violate federal law or not. They figure until someone has the big bucks to have a lawyer spend years in court, they can collect fines from the common person. Bad scanner laws are only one instance of these actions.

I hate to tell you, but, they work on Doppler shift. They use a CW beam
and you reflected signal is comapred against the original signal. Moving
radar has two beams, one is a High beam thats offset to track you the
victim, and the low beam thats pointed straight ahead and measures
vehicle speed. A nice FM Sawtooth signal centered on the radar freq jams
em quite well. Makes your speed go from -200 MPH to +200 MPH in about 2 sec.
Us countermeasure techs know this. A lot of the guns have a feature
called Doppler Audio, basically it converts the reflected signal into a
tone. The higher pitched the tone, the faster you are going.

Not meaning to sound crude or rude, but how about a copy of "Police Call"
for $9.95 from Radio Shack? It's got Michigan and Ohio public safety
frequencies in it. It's really a cheap investment and it's handy to have
around for those times when you forget freq's.

=== Repost ===

Hello fellow scanbots,

The following describes how I modified a PRO-51 to get rid of that
awful beep. With this change, you won't be able to hear the low
battery warning, either. I came up with this independently after
failing to discover anything on the PRO-51 in the net.archives.

This procedure should void your warranty and may wreck your radio.
Neither I nor my employer assume any responsibility for any damages
you or anyone else may incur from this information!

==Radio Shack PRO-51 modification to remove !!BEEP!!==

This change was performed successfully on a unit coded "11A3."
The CPU in this unit was marked "Uniden UC1581." Use the
following information at your own risk!

Orientations are with the set flat on a work surface, LCD display
facing down, with antenna BNC and knobs facing away from yourself.

As with any electronic instrumentation, remove all power and take
all necessary precautions to prevent damage from electrostatic
discharge (ESD).

CAUTION:

Be aware that parts of the circuitry will *still* be powered!
There is a capacitor on the digital board that keeps the channel
memory alive. This capacitor may contain enough energy to damage
the electronics should a short occur.

Opening Case

Fortunately, this set is very easy to open. Open battery compartment and remove batteries. Remove four screws: two straddle the sticker on the back of the cabinet, two others at the upper part of the battery compartment. There are two small plastic detents at the floor of the battery compartment. They are directly downwards from the "-" and "+" legends, which are molded on an extension of the removable back. These detents will need to be unhitched to allow the back to separate from the front. Pull back off gently.

Remove RF board

The RF board is attached to the top panel, which contains the volume and squelch controls and the antenna connector. At this point, the board is essentially free and will separate from the rest of the set when the header connector at the lower right is pulled apart. This header provides electrical connections between the two boards. Lift the RF board straight out, exposing the CPU board.

Remove shield from CPU board

The metal shield is held by four screws. The same screws also fasten the board, which forms part of the keyboard, to the front of the case. Remove screws and lift the shield straight out. Remember the correct orientation of the shield. Do not allow CPU board to come out of case. DO NOT drop any hardware on to this board, nor allow the shield to contact any of the components.

Cut circuit trace

The ASCII diagram below illustrates the area covered by the lower right corner of the shield that was just removed. Cut the trace that leads to the center one of three plated-through lands. Take care not to damage any components or other traces. Do not put excessive force on board. Remove any metal particles before re-assembly.

```

Moy Wong (moy@xp.psych.nyu.edu) Dept. of Psychology, New York University

Hello fellow scanbots,

Radio Shack PRO-51: Modification to shorten squelch tail

This change was performed successfully on a unit coded "11A3." The CPU in this unit was marked "Uniden UC1581." Use the following information at your own risk! Neither I nor my employer are responsible for any damages you may incur from this information!

Orientations are with the set flat on a work surface, LCD display facing down, with antenna BNC and knobs facing away from yourself.

As with any electronic instrumentation, remove all power and take all necessary precautions to prevent damage from electrostatic discharge (ESD). This modification requires fine soldering and familiarity with surface mount devices.

CAUTION:

Be aware that parts of the circuitry will *still* be powered! There is a capacitor on the digital board that keeps the channel memory alive. This capacitor may contain enough energy to damage the electronics should a short occur.

Parts required: One 1/10th watt carbon resistor, 100K to 220K. Value is not critical. A lower value shortens the time the squelch remains open after incoming signal stops. The resistor should physically as small as possible.

Opening Case

Fortunately, this set is very easy to open. Open battery compartment and remove batteries. Remove four screws: two straddle the sticker on the back of the cabinet, two others at the upper part of the battery compartment. There are two small plastic detents at the floor of the battery compartment. They are directly downwards from the "-" and "+" legends, which are molded on an extension of the removable back. These detents will need to be unhitched to allow the back to separate from the front. Pull back off gently.

Remove RF board

The RF board is attached to the top panel, which contains the volume and squelch controls and the antenna connector. At this

point, the board is essentially free and will separate from the rest of the set when the header connector at the lower right is pulled apart. This header provides electrical connections between the two boards. Lift the RF board straight out, and set the rest of the radio aside. Flip RF board over, keeping BNC pointing away from yourself.

Add resistor

Refer to the ASCII diagram below. Bend one of the resistor leads close to the body of the resistor so that the resistor forms a hairpin shape. Trim leads and solder the new resistor in parallel with the chip resistor marked "105." The latter is positioned between the two surface-mount IC's towards the bottom of the RF board. Press the new resistor parallel to the circuit board, making sure there are no shorts.

> Have you been able to actually measure current while the unit is off?
>

Are we talking about the natural and irritating of Nicads to just discharge over time here, or the scanner using power to maintain its memories when switched off? I would suspect the latter is not much, since I sometimes leave my Pro39 for days without any power source applied and the memories remain intact.
I heard something like it must actually be switched "OFF" or problems arise...

I have found that in the 380MHz band and above that the rubber duck is
not much worse than the telescopic. THe telescopic picks up quite a few
bits and pieces in the 137-174 band that the duck just misses, mainly
PMR stuff.
I haven't had much luck in the Lo band (68-88). I am not sure whether the
telescopic should be fully extended or whether the bit above the loading
coil should be collapsed....

Technically he is right, but it is a minor point. The "official" names of
the licenses are "Technician" (this is the one where you don't take a code
test), and "Technician Plus" (this is the one where you do take the code test).
There is no license that is officially known as "No-code Tech(nician)", "Tech
Lite", or half a dozen various other slang names for what officially is called
"Technician".

Well, not quite on this one either folks. The FCC did issue an order that
says hams are exempt from all state and local scanner laws, but only for
ham transceivers that also receive public service frequencies. It does not
apply to scanners, and both the FCC and the ARRL have stated this several
```

times. And before anyone asks, no, a handy-talkie attached to the top of a scanner with duct tape does not make the scanner a transceiver. Also, the FCC did not pass this ruling until late 1993 or so. The last states that did not exempt hams changed their laws in 1992, so for all intents the FCC ruling has no effect at the state level (and before the trivia buffs ask, the last two states with scanner laws that forbid mobile operation of scanners to exempt hams were Kentucky and New Jersey, and both were changed in 1992).

As someone else stated before, the main reason states changed their laws, and the reason the FCC issued its ruling, was because almost all 2 meter radios sold also have the capability of monitoring public service frequencies in the VHF range (the only one I can think of off hand that won't is the Radio Shack HTX-202). Until the laws were changed, this technically made most ham operators into violators if they had a 2 meter ham radio inside their car. And even after the states with scanner laws changed theirs, there are still a number of cities and counties that have scanner ordinances on the books, hence the need for the FCC ruling.

Just wondering if there are any military aviation scannists out
there (especially midwest) that have noticed a considerable upsurge
in communications in the 200-400 MHz bands lately.....

There has been considerable aerial refueling going on in my area lately,
and I get the feeling (without directly revealing the contents of what
I've heard, just a "feeling") that - as the phrase goes, and no pun
intended - something is up.

Rather than getting into gory details here, anyone in the midwest (Missouri,
Illinois, Indiana, Ohio areas) who does this, please feel free to
email me for discussion. Others who listen in other areas and have noticed
any similar upsurge in the last month may also feel free to email
me.

I *do* think it is a discussion best kept OUT of the newsgroup.

: : scanners. They can have ham gear that scans, but not scanners. They
: : aren't exepmt.

Those states that have "scanner" bans (they actually don't
ban scanners, they ban receivers capable of receiving police),
fully exempt hams regardless of the equipment being used.

: No, at least in Indiana, the law is in reference to receivers that can
: pick up police calls, and specifically exempts persons holding a ham
: license. I think a lot of states are like this.

True.

: The FCC says that no state can outlaw a ham transceiver that picks up
: police freqs, but does NOT address scanners.

True, but an argument could be made that a scanner in conjunction with
any other transmitting equipment does constitute a transceiver.
No one has tried that, yet I've not heard of anyone having to use
the FCC preemption yet as those states with the problem laws all
exempt hams completely.

: says hams are exempt from all state and local scanner laws, but only for
: ham transceivers that also receive public service frequencies. It does not
: apply to scanners, and both the FCC and the ARRL have stated this several
: times.

I haven't seen any FCC statement to that effect. The actual FCC
order/ruling contained no definition as to the use of the word
"transceiver." The position of the ARRL is irrelavent as they
are not a governing body for FCC regulations.

: And before anyone asks, no, a handy-talkie attached to the top of a
: scanner with duct tape does not make the scanner a transceiver.

I think it'd be more prudent to suggest that no challenge has been
made based on such a possibility. Since ham equipment can be
home/brew (i.e. home-made) the co-packaging of a scanner and some
type of ham transmitting equipment in something more than duct-tape
would seem to pass the test of being a transceiver. Nothing in
the FCC notice stated that only a transceiver made commercially
was to be the definition of "transceiver."

: Also, the
: FCC did not pass this ruling until late 1993 or so. The last states that
: did not exempt hams changed their laws in 1992, so for all intents the FCC
: ruling has no effect at the state level (and before the trivia buffs ask, the
: last two states with scanner laws that forbid mobile operation of scanners
: to exempt hams were Kentucky and New Jersey, and both were changed in 1992).

True, and here in New Jersey the law was totally changed and anyone
can now have a mobile scanner in their vehicle, not just hams.

: As someone else stated before, the main reason states changed their laws, and
: the reason the FCC issued its ruling, was because almost all 2 meter radios
: sold also have the capability of monitoring public service frequencies in the

: VHF range (the only one I can think of off hand that won't is the Radio Shack
: HTX-202). Until the laws were changed, this technically made most ham
: operators into violators if they had a 2 meter ham radio inside their car.

Actually, most of the states with ham exemptions have exempted
hams for many years because the hams in those states pressed their
legislatures for the exemption, usually based on community service,
etc.

: And even after the states with scanner laws changed theirs, there are still
: a number of cities and counties that have scanner ordinances on the books,
: hence the need for the FCC ruling.

True, but there is little (none) apparent effort to press those
laws against any hams so far, even before the FCC notice.

Bottom line, if you live in one of the "oppressed" states that
don't allow scanners in cars, get a ham license and buy one of
the several possible ham rigs that include full receive coverage.
One possibility is the ICOM 2SRA (2 meter transmit, receive from 25MHz
all the way to 1300MHz, older units include full cell phone coverage
too, but of course listening there is illegal:-)

Cheers,

Ke> like it very much. Would like to compare notes with other users.

Hi, Ken...

While I don't use my Standard C558A exclusively for scanning, I do use it from time to time for that purpose. Has excellent sensitivity with out any hint of intermod. The use of the CTCSS decoder in the radio is excellent.

Now, if Uniden or Radio Shack could get this kind of sensitivity without intermod and include CTCSS in a portable, I know people would be lining up to get one.

>Thanks.

The important thing is the resonant length of the aerial - lower frequencies = longer wavelengths = longer aerial. So, listening to that freq you'd theoritically need a wire aerial about 300/1/4 = 75 metres long.

What a standard AM radio does, though, is use wire coiled around a ferrite core (a non-conducting magnetic substance) which then has the same resonance as that 75m long aerial, and can therefore pick up the same frequencies.

So, to pick up AM broadcast band you could either get a 75m long garden, or find a spare ferrite coil and attach it to the antenna socket somehow.

I haven't tested either of these, but it might work. Worth a try?

Ro> for a low cost, easily cellular modifiable, handheld scanner. from
Ro> reading the FAQs, and popular communications, two models have stood out
Ro> so far, the bearcat 220xlt, and the realistic pro-34. are there any
Ro> others as good or better than those for less than $200, and if i buy a
Ro> brand new one off of the shelf, will i be able to modify it with plans
Ro> i have obtained from the ftp sites and various cd-roms?

The 220 from Uniden is not modifiable. However, I have heard that you
can receive the transmissions via the image method. I believe adding 21.6
Mhz (give or take .1 or .2 Mhz) will get the channels, though not all of
them.

The '34 is modifiable, but is no longer available.

>Newsgroups: rec.radio.scanner
>Subject: PRO-51 Mod: Removing Beep
>Date: 17 Sep 1994 21:57:45 -0500

Hello fellow scanbots,

The following describes how I modified a PRO-51 to get rid of that
awful beep. With this change, you won't be able to hear the low
battery warning, either. I came up with this independently after
failing to discover anything on the PRO-51 in the net.archives.

This procedure should void your warranty and may wreck your radio.
Neither I nor my employer assume any responsibility for any damages
you or anyone else may incur from this information!

==Radio Shack PRO-51 modification to remove !!BEEP!!==

This change was performed successfully on a unit coded "11A3."
The CPU in this unit was marked "Uniden UC1581." Use the
following information at your own risk!

Orientations are with the set flat on a work surface, LCD display
facing down, with antenna BNC and knobs facing away from yourself.

As with any electronic instrumentation, remove all power and take
all necessary precautions to prevent damage from electrostatic
discharge (ESD).

CAUTION:

Be aware that parts of the circuitry will *still* be powered!
There is a capacitor on the digital board that keeps the channel
memory alive. This capacitor may contain enough energy to damage
the electronics should a short occur.

Opening Case

Fortunately, this set is very easy to open. Open battery compartment and remove batteries. Remove four screws: two straddle the sticker on the back of the cabinet, two others at the upper part of the battery compartment. There are two small plastic detents at the floor of the battery compartment. They are directly downwards from the "-" and "+" legends, which are molded on an extension of the removable back. These detents will need to be unhitched to allow the back to separate from the front. Pull back off gently.

Remove RF board

The RF board is attached to the top panel, which contains the volume and squelch controls and the antenna connector. At this point, the board is essentially free and will separate from the rest of the set when the header connector at the lower right is pulled apart. This header provides electrical connections between the two boards. Lift the RF board straight out, exposing the CPU board.

Remove shield from CPU board

The metal shield is held by four screws. The same screws also fasten the board, which forms part of the keyboard, to the front of the case. Remove screws and lift the shield straight out. Remember the correct orientation of the shield. Do not allow CPU board to come out of case. DO NOT drop any hardware on to this board, nor allow the shield to contact any of the components.

Cut circuit trace

The ASCII diagram below illustrates the area covered by the lower right corner of the shield that was just removed. Cut the trace that leads to the center one of three plated-through lands. Take care not to damage any components or other traces. Do not put excessive force on board. Remove any metal particles before re-assembly.

3363. Tone Readers

Newsgroup: rec.radio.scanner
Date: 1995-03-15 19:03:50 UTC
From: seguine@sirius.com
Message-ID: <seguine-1503951102550001@slip167.sirius.com>
Source record: 260224
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I've decided to get a tone reader to compliment my AOR8000. The two I've narrowed it down to are the Opto DC440 and the Universal M-400. The opto is cheaper and decodes CTCSS, DCS, and DTMF. I know what that stuff is and thats pretty much what I was looking for. The M-400 does that plus all this other junk: Baudot, Sitor, Swed, Fec-a, pocsag, golay, acars, etc. What is all that? The only ones I've heard of are pocsag/golay - aren't these pager standards?
The m-400 is a little more $$ and a little bigger so I'm trying to find out if any of those other protocols are worthwhile. Thanks for the info.

Some states do not care if they violate federal law or not. They figure
until someone has the big bucks to have a lawyer spend years in court,
they can collect fines from the common person. Bad scanner laws are
only one instance of these actions.

>Soundblaster 16 to digitize something thats being RX on the scanner?
>
Woody,
Don't use the MIC input of a soundcard....the output from a scanner's
earphone or tape outputs will be much too loud for the input, and will
distort badly. If you're using the earphone output, you'd have to turn
the volume WAY down to reduce the level enough...and there is no volume
control for a "tape" output.

Hopefully, your soundcard has a LINE input as well. This will easily
handle the input level from the scanner....no distortion...no problems.

Good listening!

3367. BC100XLT Mod questions

Newsgroup: rec.radio.scanner
Date: 1995-03-15 20:24:49 UTC
From: abrant@ARL.MIL
Message-ID: <9503152019.aa27691@TBD2.ARL.MIL>
Source record: 260078

Hi all,

I just got a BC-100XLT scanner and want to do some mods.
The first one I would like to do is to the scanning speed,
in the mod file it said I will need a small crystal or
ceramic resonator in the 600-800 kHz range. Does anyone
have a source or part number for this item?
My next question is on fixing the low battery problem I
have, there seem to be 4 different fixes. Which one is best:

1. replace a diode and resistor (values are given in the mod file)
2. put a jumper across the diode
3. put a 6.8K resistor across the diode
4. remove the resistor and diode

I guess I will have to increase the mem. to 200 also:)

Thanks,
Andy <abrant@arl.mil>

Source record: 260084

I have a BC200XLT and it doesn't pick up too much anymore. I thought it was because of the antenna. The electronics guy says these scanners lose sensativity over the years. Is this true? If so, how do I get it back? I think he was just trying to sell me the new BC2500XLT (Which he did) 8*).....Can the 200 be fixed?

Also, he said there are no mods for cellular on the 2500, whereas I just picked one up right here..Thanks to the poster! The guy at the electronics shop said to scan from 1270 to 1293 for cellular...Please lead me in the right direction....

Paul
(kodiak@primenet.com)

Uniden Bearcat BC 200XLT - $150

- 200 channels, in ten 20-channel banks

- 29-54MHz, 118-174MHz, 406-512MHz, 806-956MHz

- restored cellular freqs

I haven't used this in over a year, so out it goes.
I'll throw in the 1993 Police Call book and a
second antenna for cordless phone frequencies.
You pay shipping.

If you don't like the price, DON'T attack me, just
make an offer.

>my window, but nothing in the standard AM band. What does the
>transistor radio have that my scanner doesn't? (I can get standard FM
>broadcasts as well as TV audio).
>Thanks.

The important thing is the resonant length of the aerial - lower frequencies = longer wavelengths = longer aerial. So, listening to that freq you'd theoritically need a wire aerial about 300/1/4 = 75 metres long.

What a standard AM radio does, though, is use wire coiled around a ferrite core (a non-conducting magnetic substance) which then has the same resonance as that 75m long aerial, and can therefore pick up the same frequencies.

So, to pick up AM broadcast band you could either get a 75m long garden, or find a spare ferrite coil and attach it to the antenna socket somehow.

I haven't tested either of these, but it might work. Worth a try?

> That is complete garbage. CMTs have been in existence for over
>10 years now, yet you mention a law "just passed" to support your claim?!

There was a "communications act" recently passed that required law enforcemnet access to communications. This was all over the net a year ago, Im sure other people remember it, they got a huge amount of signatures against it, but it breazed through. I dont know the details, but i do know why there was such strong resistnace to it. If you dont beleive me simply ask in "sci.crytography" or "alt.security.pgp". They are well aware of it ad know more about the details.

> There are encryption systems available, most just offering a low to
>moderate degree of transmission security, and some areas have
>implemented secure cellular systems for government use -- certified for
>Top Secret.

Im talking about very secure military grade systems. Programs like PGP for phones. Im not talking about frequency inversion.

> As of late, it seems like the industry has given up trying to
>spew misinformation/disinformation, & now say that the majority of the
>CMT users aren't concerned about the vulnerability of interception, & for
>those that are, encryption systems are available (they still don't

What encryption systems, can you explain what they are and how they work.

> As more areas start to phase-in the TDMA & CDMA digital systems,
>the cellular industry will use the privacy issue as one way to start
>steering people over to the digital standards.

I bet the encryption will be very weak. They will also have to allow law enforcement access to the system via a search warrent.

> The government certainly has an interest (whether or not it is
>'legitimate' shouldn't be argued in this newsgroup) in encryption systems
>available to the public, and that includes any cellular systems (the
>National Security Telecommunications Advisory Committee has had an
>involvement in the TDMA & CDMA standardization process), but it is stupid
>& just plain wrong to allude that there aren't cellular encryption
>products available to the public, and that it is the result of the
>government.

I never said it was the only reason, just a big part of it. A couple of questions ....

1.) Software developers can easily include military grade encryption in there software. Why dont they? It is very easy to break the password schemes on most programs.

2.) Why did the the FBI and NSA try to push clipper? The average citizen wasnt concerned about encrytion. Yet these agencies were pushing for a system they could break.

3.) Why has there been talk by some congressman to inroduce legislation to ban encryption? (I wish I saved the post I read about this in)

Im sure some people in this group remember clipper and the fight against that telecommunications act. They got thousnads of signatures against them.

Encrytion has always been considered a miltary secret and nothing has changed. It is ONE reason we do not have military grade encrytion on cellular phones. If strong encryption is ever used on commercial cellular phones. Expect alot whining and complaining from law enforcement!!!

I can hear a carrier from my AT&T 9120 (Tropez) on a PRO-2006 at 448.0
Mhz. However, no audio can be heard and the signal is lost if the phone is
moved more than 1 foot from the 2006 antenna.

Errr... a radar pulse travels one nautical mile in 6.18 us. Last time I
checked, most jurisdictions measure speed limits in statute miles. Your
military electronics instructors were correct, they just left out some
of the details <g>.

Try to program the image frequency and listen to that instead.

For example, I wanted to monitor the police on 470.3125 using
a BC760XLT, but the BC760XLT is prone to receive interference from
a TV station when programmed to 470.3125. Image rejection is
poor enough on the 760XLT (and many other radios) that I
was able to tune to 491.9125 (= 470.3125 + 2 * 10.8)
and monitor the police image there, without interference.

You didn't mention the frequency you want to monitor and
its image may fall outside the range your scanner tunes.

My grandfather used to use a BB gun. Pretty soon the birdies got too smart for that, though--they'd see him go near the window and they'd take off. So he wound up mounting a piece of suet on a tree in the back yard, with a copper perch under it. Then he ran a 115-volt line from the perch into the house and connected it to a light switch on the wall. So when one of 'em landed on the perch, he could just go over and . . .

What?

Oh. Never mind.

From: lou@gary.com
Message-ID: <7791-237876002@gary.com>
Source record: 260105

Hi and thanks for reading this,

I am in need of a couple of parts, or at least just the one main part.

The part is: The case top for a Regency MX 3000 scanner. Someone brought the scanner to me, and apparently something had been dropped on it, the case was cracked right at the speaker grill and the speaker cone was busted.

I can probably get a replacement speaker locally or from a reputable parts supplier, but I need the case if I can get one.

If you have a case, either the top or if necessary, the whole thing if you don't wish to half it up, let me know the asking price with shipping included.

Radio Shack carries a 10 Watt version of the speaker size needed, but I want to install that big of speaker. If you've got a scanner which died due to bad chips or ?, then perhaps you can help me out. Any help would be appreciated. If you do reply, please answer directly. Although I read this forum quite often, sometimes I only log onto the BBS to check for mail without going into the forums, so I may not get your reply.

Thanks

Lou

There's a bit in the FAQ file in rec.autos.driving, that basically says
these units are ineffective. I don't remember the details.

Yes, there are many air to air refueling missions every week. Something
is up and it's called practice. If these missions aren't conducting
frequently the pilots would be in real trouble if they were in a war and
had to remember what to do. These refueling missions are as common as
changing underwear. Nothing to get excited about, actually it's
interesting scanning sometimes. I heard a mock dogfight last summer and
it lasted for an hour or so.

If the alert light does come on for any received transmission, not
just the extenders then it's a TOTALLY useless feature and the
Beartracker ads are even more misleading then they already are.

The light's advertised purpose is to let you know when you're close to
a patrol car (3 miles, I think). So if it comes on everytime the radio
receives a signal it'll come on when you're hearing a patrol car
waiting for you just over the hill and also when you're hearing a
patrol car that's 100 miles away and coming thru a repeater.

>Bishwa Shrestha, KC7JFV

I think at least some of those freqs are Denver Center (enroute air
traffic control) rather than Denver Airport itself. In either case,
you're too far away from Denver to receive the Denver Airport itself
even with an outdoor antenna. However you might be within receiving
range of one/more of the Denver Center remote site if there are any in
your area.

Generally speaking, you need to be within about 30 miles of the
facility to receive it's transmissions unless, of course, you are at
higher altitudes, i.e., an airplane.

Uniden Bearcat BC 200XLT - $150

- 200 channels, in ten 20-channel banks

- 29-54MHz, 118-174MHz, 406-512MHz, 806-956MHz

- restored cellular freqs

I haven't used this in over a year, so out it goes.
I'll throw in the 1993 Police Call book and a
second antenna for cordless phone frequencies.
You pay shipping.

If you don't like the price, DON'T attack me, just
make an offer.

>a conversation going on for any particular agency ?

>Or should I just hang up my scanner and go back to watching sitcoms :-/

Of course what you were describing is a Trunked radio system, I use them
at work on our Motorola MTX9000's.

I know there are other systems, but on the Motorola system, a scanner
equiped with CTCSS receive decoding, is useless for following any
particular call. The trunking controller connected to the repeaters
communicates to each radio on the system via one channel specifically set
aside. This channel identifies each radio and switches the channels for
each talk group as appropriate. This code is digital, not a simple sub
audible tone. Sorry, not what you wanted to hear. Now I don't know much
about the other systems such as GE's which I think uses tones in a manner
to perform much the same function. I'm sure somebody could educate us on
that system.

As far as CTCSS, I have a Uniden/Bearcat 760xlt with CTCSS board. It's for
sale, you pick up $250 perfect/almost new condition.

There was a "communications act" recently passed that required law
enforcemnet access to communications. This was all over the net a year
ago, Im sure other people remember it, they got a huge amount of
signatures against it, but it breazed through. I dont know the details,
but i do know why there was such strong resistnace to it. If you dont
beleive me simply ask in "sci.crytography" or "alt.security.pgp". They
are well aware of it ad know more about the details.

> There are encryption systems available, most just offering a low to
>moderate degree of transmission security, and some areas have

What encryption systems, can you explain what they are and how they
work.

> As more areas start to phase-in the TDMA & CDMA digital systems,
>the cellular industry will use the privacy issue as one way to start
>steering people over to the digital standards.

I bet the encryption will be very weak. They will also have to allow
law enforcement access to the system via a search warrent.

> The government certainly has an interest (whether or not it is
>'legitimate' shouldn't be argued in this newsgroup) in encryption systems
>available to the public, and that includes any cellular systems (the
>National Security Telecommunications Advisory Committee has had an
>involvement in the TDMA & CDMA standardization process), but it is stupid
>& just plain wrong to allude that there aren't cellular encryption
>products available to the public, and that it is the result of the
>government.

I never said it was the only reason, just a big part of it. A couple
of questions ....

1.) Software developers can easily include military grade
encryption in there software. Why dont they? It is very easy
to break the password schemes on most programs.

2.) Why did the the FBI and NSA try to push clipper? The
average citizen wasnt concerned about encrytion. Yet
these agencies were pushing for a system they could break.

3.) Why has there been talk by some congressman to inroduce
legislation to ban encryption? (I wish I saved the post I read
about this in)

Im sure some people in this group remember clipper and the fight
against that telecommunications act. They got thousnads of signatures
against them.

Encrytion has always been considered a miltary secret and nothing has
changed. It is ONE reason we do not have military grade encrytion on
cellular phones. If strong encryption is ever used on commercial
cellular phones. Expect alot whining and complaining from law
enforcement!!!

Try to program the image frequency and listen to that instead.

For example, I wanted to monitor the police on 470.3125 using
a BC760XLT, but the BC760XLT is prone to receive interference from
a TV station when programmed to 470.3125. Image rejection is
poor enough on the 760XLT (and many other radios) that I
was able to tune to 491.9125 (= 470.3125 + 2 * 10.8)
and monitor the police image there, without interference.

You didn't mention the frequency you want to monitor and
its image may fall outside the range your scanner tunes.

Oh they work alright. I think you're thinking of passive jammers---->GARBAGE!
These units have been tested by Car and Driver Autotronix etc and they
all say that ACTIVE jammers do work. A few companies have been in
buisness for quite a while and it makes me wonder if they really are
legal. If they weren't wouldn't the FCC come a knockin??

I'm familiar with the act you're talking about, but am still waiting for
you to come up with a logical tie between it & the assertion that there
aren't any cellular crypto systems available to the public.

>Im talking about very secure military grade systems. Programs like PGP
>for phones. Im not talking about frequency inversion.

It would have been nice if you had indicated that in the first place.
I thought there was some sort of 'VoicePGP' product under development.
Noone but yourself is stopping you from designing & implementing a "very
secure" transmission security system to use on your cellular phone.

>>CMT users aren't concerned about the vulnerability of interception, & for
>>those that are, encryption systems are available (they still don't
>>advertise the crypto systems much, because it would be a Catch-22
>>situation).
>
>What encryption systems, can you explain what they are and how they

Call some cellular service providers & some of the voice encryption
product dealers/manufacturers. With the interest you've expressed in the
cellular/crypto issue you *should* already be familiar with some of the
stuff out there, but since you apparently aren't, I suggest you contact
PacTel Cellular in CA) & Transcrypt (Lincoln, NE) for a start.

>> As more areas start to phase-in the TDMA & CDMA digital systems,
>>the cellular industry will use the privacy issue as one way to start
>>steering people over to the digital standards.
>
>I bet the encryption will be very weak. They will also have to allow

>law enforcement access to the system via a search warrent.

You seem to have the habit of voicing strong opinions based on a "bet."
Who determines what "very weak" encryption is? Hopefully someone that
does more than just "bet."
I've got news for you -- you have to let law enforcement access your
house, if they have a valid warrant! If you don't believe in search
warrants, that's a separate issue which I sure don't have time for,
especially in this radio newsgroup. The valid concern I've seen
discussed regarding Clipper, et al. is the sanctity of the keys, in terms
of key management & oversight, but there's a separate newsgroup or two to
discuss that (not that I will...).

>I never said it was the only reason, just a big part of it. A couple
>of questions ....
>
Maybe not, but it was the only reason you chose to list to
support your premis.

> 1.) Software developers can easily include military grade
> encryption in there software. Why dont they? It is very easy
> to break the password schemes on most programs.

Rhetorical question: You could easily put up armor plate and
vault-doors up to protect your home. Have you done so (I'd almost "bet"
that you haven't)? If you just have the standard wood/brick exterior,
glass windows & a deadbolt on the door, "it is very easy to break" into
your house! Using YOUR logic, if your house isn't constructed like a
maximum-security facility, it is because someone (the government) wouldn't
let you do so...
The password protection scheme on something like WordPerfect is the
equivalent of the lock on your door. It is a minor obstacle &
deterrent. Just like it wasn't up to the builder of your home to know
that some day you might have the Queen's Jewels in there, it wasn't up
to WordPerfect to consider that some day, you might write up extraction
plans to get a National Command Authority to one of the secure emergency
operations centers at the start of WWIII. By default, it is up to the
USER to understand the level of protection necessary (although getting
back to cellular, as I've said before, the industry made it difficult),
and to ensure that the material (be it the Queen's Jewels, or NCA
Emergency Action Plans) is protected as best you can afford to do so.
You indicated you think that PGP offers 'military-grade' security. So
use PGP to protect your files, then!! The government users other
encryption & physical security measures to protect their classified
WordPerfect documents!

> 2.) Why did the the FBI and NSA try to push clipper? The

They wanted to get it to the other side? ;)

> average citizen wasnt concerned about encrytion. Yet
> these agencies were pushing for a system they could break.

Sorry, but I called up Louie Freeh & DIRNSA (on my STU-III, of course!), & they won't let me speak on their behalf. But if I did, I wouldn't do so in rec.radio.scanner.

> 3.) Why has there been talk by some congressman to inroduce
> legislation to ban encryption? (I wish I saved the post I read
> about this in)

I have no idea, but if I did...(reread 2nd sentance in my response to your interrogatory #2)

> >Im sure some people in this group remember clipper and the fight
>against that telecommunications act. They got thousnads of signatures
>against them.

Uh-huh... And again, your point was...?

>Encrytion has always been considered a miltary secret and nothing has
>changed. It is ONE reason we do not have military grade encrytion on
>cellular phones. If strong encryption is ever used on commercial
>cellular phones. Expect alot whining and complaining from law
>enforcement!!!

You're wrong. "MILITARY" grade encryption has always been considered to be a "military secret." There are plenty of products out there offering a respectable level of protection for individuals & commercial interests. If you don't think so, you must be quite a cryptologist/mathematician/computer programmer with some decent computational equipment.

Also, if "strong encryption" is ever used on commercial cellular networks, the only thing that *I* will ASSume is that there will still be plenty of people questioning (read: "whining & complaining") the integrity of the crypto engine/key management! There are plenty of people that think anything available to private citizens MUST be compromised by the government, since otherwise, the big, nasty government would never allow the product to be available!

If you'd care to continue this discussion in a manner that makes it directly relevent to cellular phones, I'll be looking forward to your reply. Otherwise, there's a group called talk.politics.crypto, or something like that which would be more fitting, since you've gotten us off the original question about crypto systems for CMTs.

Tim

There's a bit in the FAQ file in rec.autos.driving, that basically says
these units are ineffective. I don't remember the details.

3410. CTCSS

Newsgroup: rec.radio.scanner
Date: 1995-03-16 07:50:53 UTC
From: chared@aol.com
Message-ID: <3k8qkt$4cj@newsbf02.news.aol.com>
Source record: 260033

I work for a daily newspaper and have a few questions about CTCSS boards. I have a PRO-2006 at home, but my office only has a crappy BC-855XLT. I'm trying to get them to buy a new scanner and think that I can sell them on the idea (our sheriff's dept. has gone to 800 MHZ and shares some freqs with local businesses; during the day all we hear are construction workers, so it gets turned off). I see that Bearcat has a CTCSS board available for the 890XLT in the Grove catalog.
1) Will it only work on the 890XLT, or can it be installed in our 855XLT? The April 95 PopComm says that it works fine in all Bearcats. Anybody familiar with it?
I would appreciate any info/specs/advice anybody might have.
Mail me at randall.hixson@pcflorida.com if possible. Thanks

> Any ideas?

Tim,

Try EDCO (Or EEB - same crew). The lead is the same for the current AOR AR3000A so I would think they could help. If not try ACE - they handled AOR prior to EDCO and prior to becoming ACE I beleive there was a family connection to the Regency Co. who handled the MX range and others.

If that doesn't work I can help.

You will need to use a PSU with a 12v output, 500ma would be best.

The MX5000 was the same as the AR2001
MX8000 was a AR2002

MX7000 was a MX5000 with the extended coverage of the MX8000

Bishwa,
If you'd like up to date frequency information for aero comms there
are several very inexpensive government publications available to
help you in your local area.
First, I'd get the "U.S. Terminal Procedures" publication for your
area, in this case Volume SW-1. The publication lists every freq
in use and its purpose for every airport in the volume's area.
I pay $3.60 for the volume. Go to any airport, especially an
operator that gives flying lessons, and ask for the volume that
covers your particular area. They would be happy to help you.
ALSO, get the "Airport/Facility Directory", another cheapo govn't
publication that has EVERY airport in the country and very
important information for each.
All of the above publications have expirations of several months and
you might even be able to cut a deal with the aiport and get a
bunch of older 'expired' ones laying around free or at bargain
prices.
The aero maps, called 'sectionals', also have good info but you'll
spend some time sorting it all out. I don't see the need for this
unless in your air scanning you'd like to see VOR names, intersection
names, airway names etc to get some idea where a plane is located.
Hope this helps you and the newsgroup,
Happy aero scanning,
Matt - WA2TPX

Well, I believe you said that the radar sends out a pulse and when it
recieves a return it computes all the BS. It uses no pulse at all. It is
a continuous wave and the reciever recieves back a signal that is off the
center freq. The difference is your speed.

He was just correcting the original statement that RF signals
propagate at 'a constant speed of of 1 mile in 6.18 microseconds.'
^^^
Where such a measurement can be used was never under discussion.

I will further nitpick and say that it is only constant in a vacuum,
and in air the actual speed is 6.1777...*sqrt(Er) micro-s/naut-mile where
Er is the relative dielectric constant which is a function of
air density (and a lot of other things).

My guess would be the added elevation of the aircraft allows you to
recieve thier singal. It would be like having a 900 foot tower. I beleive
it's northwest that runs that TV ad about back before "airfone" or
whatever, they could reach Chicago from Minneapolis on a good day.

R>
R> "DON'T EXPECT PRIVACY ON CORDLESS PHONE"
R> By "The Arizona Republic", Tucson, Ariz.
R>
R> "Drug dealers and everybody else should know not to expect privacy
R> when they talk on cordless telephones, the Arizona Court of Appeals
R> says.
R>
R> In a unanimous decision, the court's Tucson division has rejected
R> Ana Patricia Duran's argument that a search of her home, during which
R> large bags of marijuana and drug paraphernalia were discovered, was
R> based on an illegal wiretap.
R>
R> Police got a search warrant after Duran's neighbor, an off-duty
R> sheriffs deputy, intercepted her cordless-phone conversations with
R> his radio scanner.
R>
R> Duran later was found guilty in Pima County Superior Court of
R> possession for sale of marijuana and was sentenced to five years in
R> prison. She appealed, arguing that the search of her home violated
R> wiretap laws and, therefore, the evidence found could not be used
R> against her.
R>
R> Wiretap statutes protect wire, electronic and some oral communications
R> from unauthorized interceptions. Under the law, the radio waves between
R> a cordless-telephone handset and its base are not considered wire
R> or electronic communications.
R>
R> Based on the widespread use of cordless phones and the common knowledge
R> of how they work, Duran had no reason to believe that her talks would be
R> confidential, the court said in its Feb 28 opinion."

That was then, this is now.
What the Supreme Court said, was: "*THAT* police action was legal."
Now is different. *AT THAT TIME*, listening to cordless phones was legal.
Now, it's not. There has been a great deal of confusion on that. Channel 10
even had a talking head, while reporting this, look straight into the
camera, and say it is legal to monitor cordless phones. It's not.

>>stationary) Radar signals (Rf) travels at a constant speed of of 1 mile
>>in 6.18 microseconds. So the circuitry in the gun starts a timing
>>circuit when the gun fires and times the length until the pulse returns.
>>This would be for a unit that was not in motion, cop parked.

This will give distance, not speed. A doppler shift detection circuit is
used to determine speed. A modulated RF carrier is directed towards a
target. The moving target will compress (or expand, if moving away) the
modulation. You've heard this as a train moves past with the horn going: the
frequency drops as the train passes. Traffic radar measures that change in
the modulation to determine speed.

>> For a car in motion the gun sends out 2 pulses, one a little off to the
>> side of the car to bounce of a stationary object on the side of the road
>> to tell the gun how fast the cop car is moving thus determining the
>> doppler shift caused by the cop car movement. Then the second pulse
>> bounces off the target car and that doppler shift and the one from the
>> cop car are mathmatically figured to determine the target car speed.

The second signal is directed downwards to the road surface; it uses doppler
to determine the transmitter's speed. The other beam is as above, and the
two are compared, the transmitter's speed is deducted from or added to the
target's speed, depending on direction of travel of the target relative to
the transmitter.
Moving radar use can be done easily with a single-mode radar unit by first
getting the relative speed of the target, then taking a reading of the road,
and adding (or subtracting) that reading from the target's reading. ot done
very often, for various reasons.

BV> speakers and things like that). What law would make them illegal?

While their research into transmitter power is correct, they are forgetting that ANY attempt to jam ANY transmission is illegal, and jamming a public service transmission will get prompt action from many areas: local (obstructing justice comes to mind) and Federal (several FCC rules cover interference, both accidental and intentional).

DM> them! Each department can invent their own code, and many do.

Actually, you will find that most Police Dept's use the APCO (Associated Public safety Communications Officials, inc.) ten signals list. This list goes up to 10-34 (Time). 10-35~39 are reserved for future use by APCO, and from 10-40 up can be defined by the using department. So, while 10-90 could mean "officer down - need help" to one department, another might have 10-90 mean "I need a 35mm camera". Yet, 10-17 should mean "Enroute" to most departments.

While the argument could be made, the FCC has specifically stated that it
will not listen to the argument.
The FCC does not consider scanners to be HAM equipment. At all.
Also, there are several localities that ban scanners. And, a state that has
a ban on such equipment in vehicles is not affected by the FCC action, as
far as scanners are concerned. Only HAM gear.

MC> I checked in the FAQ and found nothing. Does anyone have a reference
MC> for police codes used on scanners?

Most police dept's use a few different code systems. The APCO 10-code system
is one (10-4, for example, means affirmative, or OK). Then there are
dispatch codes (code 2 may mean lights, no siren). The APCO codes are
standardized up to 10-39. From 10-40 up can be whatever the dep't wants.
other codes are particular to each dep't.
Where to get them? Find a local listener club, even a HAM club, as many HAMs
are scanner listeners, too. Local frequency guides will often have this
info. Here in Az., the AFD has it, if you can find one.
Where are you?

That's an easy one. The FEDS want to be able to snoop (legally, of course) on all communications in this country. CLIPPER was pushed as a method to provide security for the user, and still allow the gov't to eavesdrop. The intention was for the Clipper chip to become the default or universal encryption method, thus enabling the Feds to only have one (or at the most, a few) systems to get into. One of the reasons this failed was because the really smart people in the Government (both of them ;-)) finally figured out that if you first encrypted your data, then sent it through Clipper, the Feds would only get encrypted data after using the Clipper keys. Duh!

Gee, how many wires have to be interconnected between the transmitter and
the scanner? Is wire wrap OK, or do they have to be soldered? Does the
transmitter have to switch the scanner on/off?
Isn't it really enough to say that the recent FCC action in question doesn't
cover scanners?

I agree. Just go to a small county airport and ask. I used to go to the airport in Shelbyville, IN and they gave me all kinds of out of date (just barely) gov't publications with civillian and military frequencies in them. They just throw them away when they go out of date. They would be happy to give them to someone who could use them.

Message-ID: <1995Mar16.130114.20667@driftwood.cray.com>
Source record: 260065

Wanted to buy: Used AOR8000 (unblocked)

Also, does anyone know of a better deal on a new AR8000 than these?

Javiation: $618.00 (US) includes shipping but not duty

ATLANTIC: $670.00 (US) includes shipping & duty
Atlantic also says they will give a full refund of purchase and
shipping charges if the radio gets returned to them by US customs.

The question is, does US customs return equipment that doesn't meet import regs?
Or do they keep it and put it in their annual auction?

3443. mod for PRO-51

Newsgroup: rec.radio.scanner
Date: 1995-03-16 19:28:54 UTC
From: wun-chun@phoenix.ece.wisc.edu
Message-ID: <3ka3hm$ea1@news.doit.wisc.edu>
Source record: 260063

Does anything outt there know how to mod a PRO-51,
I heard that it only requires "software" mod
that only key punching is needed.
Thanks

Chun

-*>Thanks in advance

Here is a list that might help:

-------------------------8<--------------------

Denver/Eastern Front Range/North Central CO Expanded Edition 9410

SCANlist 9410 Volume 7 #4 COPYRIGHT 1994 The Metro Comm Center/Phil Mangone.
All rights reserved. Updated 10/12/94 for Denver and the Eastern Colorado
Front Range.

Distribution of this list is at no charge and courtesy of this BBS
from the The Metro Comm Center. Use of this on-line publication for monetary
gain or republicationwithout permission of the Author in part or whole is
prohibited.

Updates to this list and other frequency lists are available for download
from The Enterprise BBS @ 659-8294 for the metro area and 785-0217 for the
Greely/Longmont/Ft. Lupton area, The King's Market BBS @ 665-6091 for the
Denver Metro area and Longmont, 225-3491 in the Fort Collins/Loveland/
Wellington area and 346-3491 in the Greeley Area. Please send all e-mail
correspondence to me through either of the above listed BBS systems.

Use of this information in the commission of a crime is prohibited
and prosecutable by Local, State & Federal Laws. I do not assume
responsibility for misuse of this information.

Due to the nature of Public Safety Communications frequencies and use
are constantly changing therefore I do not assume responsibility for
changes, incorrect information and omissions. Use of this list is to
enhance one's use of a scanner or similar type receiver.

At the time of release of this file there are no known mobile scanning
laws within the state of Colorado. However due to 'home rule' jurisdiction
allowed by the state it would be wise to check on local regulation in your
area.

I do not encourage anyone to "Chase" calls as you are asking for trouble
with law enforcement officials and they will not hesitate to prosecute.

KEY INDEXES AND DEFINITIONS

F-# Short for channel . i.e. F-1 is the same as channel 1.
###.##### S Indicates non-repeater use. Both base and mobile stations
use the same Frequency Commonly referred to as "Simplex"
PD Police Department
FD Fire Department
FPD Fire Protection District
LG Local Government. i.e. Public Works, Animal Controletc...
R-# Repeater Frequency sequence for trunked G.E. systems
M-# Mobile transmit frequencies for trunked G.E. systems
for "Input Scanning"
IFB Interruptable Feed/Fold Back. TV audio feed for reporters.

NOTES FOR OCTOBER:

AURORA 800:

On October 10th Simulcasting of the two dispatch groups and the Services
Group on the old UHF radio system were discontinued. The Auora Fire
Department will continue to simulcast their dispatch group on 154.400 until
completion of their new fire station signalling system.

DOUGLAS COUNTY FIRE:

The changeover for all of the agencies that are dispatched by the county
is completed. To our knowledge all Douglas County Fire agencies except
Parker and Louviers ares dispatched by the county on 151.115.

DENVER 800:

Same old same old. Intemittent crashes, consoles failing and four
letter verbs over the air about system manager failures. Time to string
up the equipment manufacturer in my opinion.

TANDY NEWS:

As if it were not commonly known Tandy Corporation [aka Radio Shack]
had to pull all their 800 MHz scanners that were manufactured by uniden
after the implementation of the TDDRA in April because of a factory test
mode that included one of the Cellular frequencies announced the PRO-51
should be back in the stores this month. Tandy also released the PRO-2035
the 1000 channel successor to the PRO-2006. There have been mixed comments
about the new scanner and complaints about the setup of 10 banks of 100
channels that lead to a lot of unused memory locations in cases where a
bank is dedicated to a trunked radio system which will at the most use
only 20 channels. Otherwise use for blocks of frequencies works well.
For now anyway rampant word on the street is that Tandy will be trying
to get a 400 channel triple conversion portable out by Christmas.

SEASONAL FREQUENCIES:

With the rapid approach of the winter season on us adding the highway
maintenance frequencies can be very benificial while traveling or on
the way to and from work. The Colorado Department of Transportation

frequencies are of value when traveling the interstate highways. Here is a listing of the CDOT frequencies used for the Front Range and Summit County. 151.070, 151.085 for the Metro Area and I-70 Tunnel approaches. 151.265 for El Paso County. And 159.045 for Boulder, Larimer and Weld Counties. These frequencies are allocated statewide so these will be active in other areas of the state. For specific areas look under the area jurisdiction for which you are interested in with frequencies listed as street maintenance or city services.

CREDITS:

Somebody suggested I should do this more often so... Thanks go to Randy Lynch for being himself. Bill Koppleman for spreading the word on this and the echo on the Rocky Mountain Monitoring Net on 147.225 Sunday evenings at 8 P.M. Radar Kessler for the encouragement. Jim at Mountain NewsNet for information pertaining to the reorganized Douglas County Fire communications system and South Metro Fire communciations system. Marshall Barry and Bob Whiston for getting the echo mess fixed. The people who participate in the echo and who corner me in person. And finally you who are reading this and making it worth the effort!

>
>

Eventually, everything will go digital spread spectrum since this is
a natural for multi user access. Thousands of conversations can occur
simultaneously over the same frequencies and they all look like noise
with a spectrum analyzer. In fact, the radiated energy from a single
cell phone will be less than the ambient atmospheric noise per any
certain frequency. Therefore, unless you are the phone company or the
feds, you will have to hack up a cell phone to hear anything. It's
coming. You can already go to Radio Shack and buy yourself a 900 Mhz
digital spread spectrum cordless phone that works up to one mile away.
I don't think there's much problem for the phone companies to offer a
tradein incentive program to get people upgraded. After all, the real
money is made when someone uses a cell phone.

Ro> could anyone post the modifiable date codes for radio shack pro-xxx
Ro> scanners? thanks in advance.

All of the dates are modifiable, depending on what you want to do with them. However, if you are wanting to modify a Pro series scanner for continuous 800 Mhz coverage, then anything with a datecode of 3A4 or less is the general rule. There are a couple of exceptions (such as the Pro-51, Pro-46 and Pro-23 software mods).

3448. BC200XLT Squelch HELP!!!!!!!!

Newsgroup: rec.radio.scanner
Date: 1995-03-16 19:56:26 UTC
From: gpabon@aol.com
Message-ID: <3ka55a$9fv@newsbf02.news.aol.com>
Source record: 260066

HELP!!! I own a BC200XLT and it works great except for one thing. The squelch on the unit appears to be either full on or off. In other words I'll have an active frequency tuned in, it comes in clear, then if I attempt to just eliminate the static at the bare minimum, no more signal. If I scan any banks, it doesn't pick up anything, but if I stop on a frequency like the NOAA weather, it comes in loud and clear. I have other scanners so I know it's not me. I also tried my outdoor antenna with no luck. I did buy the radio used and it has the cell mod done (although I can care less about it). Can this mod cause this problem with the squelch? Is there an adjustment that I could perform to make the squelch work properly? If so how? Thanks for any help!!!!!!

George

Very secure. They use digital spread spectrum scrambling. Sounds
like atmospheric noise, only quieter. Totally undetectable, invented
in the 1950's for the military.

92> Hi there I have a PRO-2027 scanner and I need a way to restore my 800
92> mhz band. It it currently locked out. If some one has an article
92> about this can they please post it on here or mail me a copy of this
92> article. I would really appreciate it.
92> Jamie

Here is one that I got from an unknown source. This is done AT YOUR OWN
RISK.

RESTORATION OF CELLULAR FREQUENCIES FOR RADIO SHACK PRO-2027

For those that are interested, the following modification will
enable uninterrupted
reception of the 806MHz - 960Mhz spectrum. This modification may
be useful to those
who use a scanner in conjunction with down converters for
satellite monitoring.

Be advised that this modification enables portions of the 800 Mhz band that
is illegal to monitor under United States Federal law.

With the advertisements out of the way here's how its done.

1. Unplug unit. (Obvious but I must say it.)

2. Remove bottom panel (4 screws)

3. Locate diode D35 located behind the enter key. This is a
surface mounted component
that resembles a tiny black square.

4. Unsolder D35. I prefer to unsolder one leg so that the
original functionality can be
restored for resale. This can be done by gently prying up the
component with a pin or
tweezers while touching one leg with a soldering iron. Don't
apply too much heat a 15 - 20 watt soldering iron is more than
adequate.

5. Button it up and turn it on. No reset is needed.

At 68 - 88Mhz, the antenna should be fully extended.

3453. PRO 62

Newsgroup: rec.radio.scanner
Date: 1995-03-16 21:40:17 UTC
From: ao936@yfn.ysu.edu
Message-ID: <3kab81$14c@news.ysu.edu>
Source record: 260068

I recently purchased a RC PRO 62 portable scanner. This unit will not go low enough to pick up CB freqs. The 62 starts at 30 MHz. Does anyone know if this scanner can be modified to pick the lower signals?

TIA.

Please respond email.

Regards,

Tim White

3454. Re: Tropez phones

Newsgroup: rec.radio.scanner
Date: 1995-03-16 22:11:52 UTC
From: mturner@tivoli.com
Message-ID: <3kad38$t68@tivoli.tivoli.com>
Source record: 260017

I check my Tropez last night and I could find a carrier at 450.200.
I could not detect dial tone or voice. However, if I pressed the keys on the phone
and had the volume on the scanner up as high as it would go I could hear very
very faint "signals" each time a key was pressed. If the phone was moved a
few feet away from the scanner I lost carrier.

So, this single Tropez phone appears to be "secure" to the normal scanner.

For Sale - AOR1500 with case, charger, antenna, manual, box.

Good Condition, always in case. Case has had some stitches come
loose and was re-sown. Case also has small rectangle cut in face
to make it easier viewing freq.

The radio has never been dropped or misused in any way.

It is a very nice scanner.

I will take offers by e-mail.

Thanks,
Mark

>Us countermeasure techs know this. A lot of the guns have a feature
>called Doppler Audio, basically it converts the reflected signal into a
>tone. The higher pitched the tone, the faster you are going.

I have ridden on patrol with a state trooper friend of mine and got to work the radar. You could hear the doppler shift change in pitch when the radar was operating.

BTW, my friend had to check his radar unit for accuracy after every stop using a tuning fork. He had to record that on a log sheet. He told me that it was law. It could be a defense if the radar units haven't been checked.

Date: 1995-03-17 00:27:34 UTC
From: martyf@interport.net
Message-ID: <3kal1m$apr@interport.net>
Source record: 260072
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Hey guys & gals.

I own a company that does Internet publishing services, and I have been a bit of a scanner fan for a while. Since I have the server, I figured why not put together a single source, kind of like Yahoo, for frequency information. I'm not interested in modification files or anything like that. Just basic listings of the frequencies in your town, provence, country, whatever. No flashy graphics or search engines.
The web site is operational, however, it dosen't have a bunch of frequencies in it yet. I live in New York City, so I'll put what I've got up and it's up to you all to make it work.
If you want to contribute to the database, send by email ONLY to:

freqs@okc.com

All submissions must have the following information in the first lines:

If an item not applicable, Leave Blank!

Country: State/Province: County:
Type of Service (e.g. Fire, Air, Phone, Road Crew):

And then put your file here. I'll do as much duplicate checking as I can, and please make sure you don't clutter up the mailbox with requests for a particular frequency. If I've got it, it will be in there.

There are 900Mhx cordless phones that do not use spread-spectrum
technology. These phones can be monitored. I don't think you
can monitor a spread-spectrum phone with exsisting scanner
technology.

Hello People..

I am interested in buying one of those TV Rabbits that you use to re-TX anything from your VCR to another TV as i have several movies and so on that my brother/family would like to watch while i am watching on my system.

Now I live in a detatched room seperate to the house and running cables isnt practical.

a/ What is the range of those Rabbits that TX around ~900Mhz?
b/ Is there anyway to BOOST the signal strength???

I know they dont like you to do b/ but I live out on a farm in rural Australia and basically i dont think it would matter even if the signal was boosted by a reasonable ammount as it wouldnt affect anyone...

Can someone help moi please...

Lots of times, my AR8000 stops searching or scanning
on a frequency but the audio breaks up. If I open the
squelch all the way or I use the MONI button, the
break-up clears. This problem has been reported by other
owners. (My Yupiteru 7100 did NOT suffer from this defect.)

In trying to find some cure for this problem, I've tried
using AUDIO and LEVEL modes with various SPECIAL function
parameters as specified in section 17 of the manual.
None of this experimentation seems to help with the squelch
problem. :-(

However, I did come across one discrepancy with the manual.
The SQUELCH DETECT function [FUNC] [2] [switch on] sets the
length of time provided for the squelch to determine if a
signal is present. The manual (page 99) says the default
is 80 mS. However, my scanner had the value set to 31 with
a range of 0 - 49 !

Is this a "bug" in the documentation or in my scanner?

Does anyone have a solution to the "bad squelch" problem?
It really annoys me!

My family and I will be camping at Edisto Beach St. Park for a few
days this summer. I will be bringing along a 12v., 10 channel scanner, to
monitor bad weather. Does anyone have pertinent frequencies (i.e. Co. Sheriff,
Coast Guard, 2m ham repeater, NWS) that would be helpful if bad weather
approaches?
Thanks.
Pete.

Great, this is my favorite topic and I exclusively monitor UHF and LO VHF
air-mil using remote taping techniques. Hot freqs would be nice, and
don't have to be limited to one's own state. WIth the spring/summer season
upon us, tropo ducting will be common and everyone will be able to monitor
LO, HI, and UHF air-mil freqs upwards of 500+ miles, and when aircraft are
at altitude, even further.

I'll post the more common freqs here in Maryland, and surprise, the hottest
training freqs are LO-VHF (30-40 Mhz)! Any scanner will pick them up,
and they are hot! Live weapons and all. Stay tuned....

LO>mail without going into the forums, so I may not get your reply.

LO>Thanks

LO>Lou

LO>Lou@Gary.Com

Regarding the speaker on the MX 3000, I meant to say that I do not want
to install that big of a speaker.

Jack, do you have a Reference Guide or Short Cut manual for using or changing, what I am doing on line here. Example when trying to change from one message # to the next, go from #5 BNN to #122 for example what is a quick way to do that. Now I have to go thru the whole menu to change from one item to the next. I no there is a faster way, but I just can't seem to quite figure out the short-cuts. Any help would be appreciated. Or is there a on line help dept. I looked for one. Other wise, I really enjoy using this BBS. I may be a little slow getting to the Conference I want. But the information is well worth it. Also I can't seem to get the qued conferences to work.. I no its me.. so please, I need your help... thanx Steve Finch.....

3485. Re: Amateur Raynets

Newsgroup: rec.radio.scanner
Date: 1995-03-17 09:43:57 UTC
From: gordy@gbscomms.win-uk.net
Message-ID: <226@gbscomms.win-uk.net>
Source record: 260005

In article <6839@rook.ukc.ac.uk>, Duncan (dpfg@ukc.ac.uk) writes:
>What are ham "Raynet Channel"s??

RAYNET is a voluntary organisation comprised of hams who pledge to provide communications support in times of national disaster, accidents or other problems experienced by the "user services" ie County Emergency planning, Police, Fire, Ambulance, Coastguard, St Johns ambulance etc etc

They also take part in exercises, eg bike races, sponsored walks, charity events, and multi-service emergency exercises. to provide backup comms

To answer the question directly, a "RAYNET Channel" os a channel used by RAYNET groups for emergency communications traffic. These are not "exclusive" channels, but they are listed on the bandplans to let others know which channels to avoid during times of emergency, unless they are taking part.

Some guides (one in particular) is quite misleading in what it lists as "RAYNET Channels". Anyways, the bandplans are apparently soon to be reprinted with the words "Emergency Communications Priority" instead.

My Escort 900 MHz phone freq. hops between 902 and 928 MHz
in about 100 different steps every .25 sec. Fun to watch on a
spectrum analyzer, but the digital encoded speech is hard
enough to decode, if you can catch the carrier.

Keep trying.

>2. 453.010
>3. 453.020 Sherrifs (first key up)
>4. 453.030
>5. 453.040 Sheriffs (third key up)
>6. 453.050
>7. 453.060
>8. 453.070 Sherrifs (second key up)
>9. 453.080
>10. 453.090

I am not familiar with the term "Polling" with respect to radio systems, but what you describe sounds like a trunked system. Only, trunking in the 400. MHz band is very uncommon. I don't know if you chose those frequencies just as an example, or if you are actually hearing this. More than likely, if they are switching to a trunked system, it will be in the 800MHz band. Either way, CTCSS (PL) is not typically used in these sytems and would not help you in following the conversations has they pop up on the different repeaters. About all you can do is keep your finger on the scan button.

All indications are that it is NOT restorable. However cellular images can be
received just fine, and it is likely that someone will discover a way to mod
the radio as they did with the 220XLT.

I lost the address of the person who wanted Portland, and south of
Portland freqs, so I'm posting it here so they can get them.

Here's a couple of things you can tune to when visiting Lake Oswego and
the Portland Area:

Lake Oswego

Local Gov. 453.9375
Public Works Operations 45.520
City of Lake Oswego 453.9375

Fire 153.830
Fire 154.010
Fire 154.205
Fire 154.250
Fire 154.400

From a different book:

Fire
F-1 Tap out & Fire Dispatch 154.190
F-2 Fire Operations South County 153.890
F-3 Fire Operations North County 154.220
F-4 Mutual Aid Net (State Net) 154.280
F-5 Fire Operations East County 154.325

Police F-1 Patrol & Dispatch 460.450
Police F-2 Car to Car 460.225
Metro Net 159.030

Clackamas County

County Sherif 155.610
County Sherif 158.850
County Sherif 158.970

County Sherif F-1 Dispatch & Patrol 155.430
County Sherif F-2 Dispatch & Patrol 155.190
County to County Sheriff's Net 460.500

Portland

Kex (AM) News/Traffic 450.550
Traffic Control, Inc 450.4875
(If you drive in rush hour, use that one on your priority channel!)

NOAA 162.550
(Weather from the airport, 24 hours a day)

F-1 Dispatch/Patrol (Central Precinct) (NW/SW) 460.325
F-2 Dispatch/Patrol (East Precinct) (NE/SE) 460.200
F-3 Dispatch/Patrol (North Precinct) 460.100
F-4 Multnomah Country Channel 460.125
F-5 City/County Car to Car 460.425
F-6 Special Events/Car to Car/Detectives 460.250
F-7 County Channel 460.350
F-8 Wattant Information/License checks 460.050
F-9 Tactical 460.275
Tactical/Surveillance 460.500
Tactical/Surveillance 460.6375
Portland Airport Police 460.225
Justice Center 460.550
River Patrol 158.730
Sherif Department 460.475

Portland & Multnomah County Fire

Tap-Out Channel (all alarms) 154.430
F-1 Administration 154.010
F-2 Fireground 154.250
F-3 Fireground 154.145
F-4 Fireground 154.175
F-5 Fireground 154.355
F-6 Mutual Aid (Boring/Sandy) 154.325
F-7 Mutual Aid (Happy Valley/Clackamas County/
Distric 1/Oak Lodge/Milwaukie) 154.220
F-8 Mutual Aid (Statewide) 154.280

Tri-County Emergency Medical

Dispatch (Portland/Multnomah County) 462.950
Dispatch (Washington County/Life Flight) 462.975
Operations (Washington County) 463.025
Operations (Washington County) 463.050
Univ. Of Oregon Hospital 463.075
Operations (Portland/Mult. County 463.125
Life Flight 463.175
HEAR (Ambulance to Hospital) 155.340

Oregon State Police

Portland, Boevernment Camp, Columbia City 154.935
McMinnville, Banks, Beaverton 156.225

Repeater, Portland (transmit) 155.460
Repeater, Washington County (transmit) 159.105

That should give you a start. The Portland police and Mult. County Sheriffs are in the process of shifting over to a 800 trunking system, but are still similcasting on the old freqs.

Try this. Hold down the 2, 9, Band & and turn the unit on.
You should see a test display scrolling left to right. Now
press 2, 9, L/OUT while the unit is on. Now check and see if
you have the 800 mhz in channel 23.

But, there is still no pulse! All "instant on" does is switch on the CW
transmitter. The radar gun still works the same way, it just stays silent
until the officer decides to flip it on, and when he flips it on your
detector will scream. Police radar guns never compute range (Lidar units do).

3497. BEST SCANNER

Newsgroup: rec.radio.scanner

I am new to this group and new to scanning. I am looking to purchase
my first scanner. What is the best overall value scanner on the market.
I would also like to interface this scanner to my computer. Is this
a difficult thing to do? Are there any scanners or adapters that will
pick up ham bands and shortwave bands? Any help would be appreciated.
Either answer here or my E-Mail address (pp001141@interramp.com).
Thanks Tom

>Maybe the Grove databse can help you.

Just because the crystal has a frequency on it does not mean that is the frequency you are listening to. The scanner multiplies the frequency. I can't remember the formula. It depends on if the fundamental frequency is being converted to VHF-HI or VHF-LO to figure which formula to use. It is something like: fundamental + IF x 3 for VHF high. Anybody remember?

3502. Help; Marymac/R.Shack

Newsgroup: rec.radio.scanner
Date: 1995-03-17 15:23:23 UTC
From: amike@maniac.med.miami.edu
Message-ID: <3kc9hb$r22@miasun.med.miami.edu>
Source record: 259949

A while back netters on this group turned me on
to Marymac Industries or Radio Shack. I never used
them until recently and have had a problem.

I ordered a cordless headset phone. They took my order
and said i'll would arrive in 7-10 days. 21 days later
I called inquiring about my order. Their response:

"Oh, we are currently out. I told him I asked about
availability at time of order and they said "they were
available" I asked when they expected to ship. He said:
"I don't know, pick it up locally." I said "We'll I'll
wait, will you ship pending orders? He said "No, when
we don't have an item we scrap all unshipped orders."

Has anyone experienced this? Are they trying to protect
the local stores business?, since through them items are
discounted?

BTW, they never asked my name or anything just what item
was I waiting for.

Txs,

Mike A.

3508. Ever hear a bug on a scanner?

Newsgroup: rec.radio.scanner
Date: 1995-03-17 17:41:46 UTC
From: gordonlm@u.washington.edu
Message-ID: <3kchkq$c74@nntp3.u.washington.edu>
Source record: 260023

These days, one can buy bugs in local "spy shops". They are typically labeled as baby monitors or wireless mikes for performers. Really they are intended to be planted to illegally gather information on competitors (commercial or otherwise).

They transmit in the commercial FM band (cheap ones), around 300 MHz (expensive ones), or up to 10 GHz (very expensive ones).

Have you ever heard one? I suspect that with bunches of these devices being sold they can be picked up once in a while on a scanner. My reason for asking is an interest in working with some folks doing sweeps for bugs and I suspect that people with scanners have had some interesting experiences to pass on.

You better buy their charger. They use a proprietary pulse width modulated
charging system custom designed for their batteries. Don't chance getting
bad results with your batteries. I'll never use anything else.

OK. Design a charger that delivers 2VDC pulsed, with a 70% duty cycle that
tapers to zero as the cells approach a terminal voltage of 1.6V. Of course
you'll need a separate circuit for each cell.

I've been trying, without much success to get some sort of picture from the strong signal at 137.925Mhz. I guess that it's a weather satellite, as that's what is sounds like, but I can't get any sort of picture.

I'm using JVFax 5.1 on a 486/66, with a hamcomm interface. The interface definately works, but when it's all connected up I just get at best a black screen with occasional white dots.

What's going wrong here?

Hi,

I just saw an interesting ad that had a Cell Receiver/Transmitter board set for $99. It consisted of a two channel receiver (voice/data), and a 1.5 Watt transmitter for AMPS. The freqency selection was via a 10 bit digital code (parallel). Looks like a neat item to use for building a cell scanner (not that I would) or a test transmitter for cellular testing (assuming you are authorized, etc.). No I don't have address (I need to pick up 10 or so...) but you might check the Circuit Cellar ads.

My experience is the exact opposite. I call, ask for price and availability
on RS item #. They give me a direct answer, the price is always less than
the current RS sale price. Five day delivery via UPS, no shipping charge,
no hassles.

How was the tuning fork able to check the calibration?
Is there a microphone built into this thing which can hear
the tuning fork? Is the tuning fork matched to a certain
speed/frequency corrilation?
very interesting

I can't E-mail, so I will post this change here. In Florida it is
legal to carry a PORTABLE scanner in your car. It cannot be installed.
That means you cannot have it wired to your cars electrical system,
have an outside antenna mounted on your car, etc.

>1) Will it only work on the 890XLT, or can it be installed in our 855XLT?

I have a BC890XLT with one of those CTCSS boards.
The board is not compatible with the 855XLT.

>The April 95 PopComm says that it works fine in all Bearcats.

This is incorrect. Must be a typo or an over-generalization.

>I would appreciate any info/specs/advice anybody might have.
>Mail me at randall.hixson@pcflorida.com if possible. Thanks

Avoid the BC890XLT. It is too prone to images, overload, intermod,
and birdies. I recommend you get a BC9000XLT with the
optional CTCSS board -- a top quality setup.

3527. How to find freqs on Motorola handhelds?

Newsgroup: rec.radio.scanner
Date: 1995-03-17 21:45:41 UTC
From: gregjo@wordperfect.com
Message-ID: <gregjo-1703951445410001@pcgjohnson.orem.novell.com>
Source record: 259944

Where I work, they use some Motorola handhelds to communicate.
Our security, MIS, and sometimes janitors (!) use these radios. What
range should I search to try and find these? I only have a little info.
on the radios. They are Motorolas. They have the letters 'MTX' printed
on them. At the top there is a rotary dial, as well as an A-B-C toggle.
Does the A-B-C toggle indicate each radio can communicate on one of three
channels? (Someone once told me there are 11 frequencies allocated to our
company...maybe MIS for a few, security for a few, etc.)
Is there a common set of ranges for these types of radios? Or are they
programmable, so it's wide open.....?
Thanks.

>have a good time, but don't expect to find any bargains.

I purchased an HT (new) last year at the Dayton Hamfest and found the price was
better than any mailorder firm for several months afterwards.

While I agree that some prices are 'top dollar', not necessarily everything is
more expensive there. Many dealers have specials running and will actually
compete with each other.

I'd go to Dayton even if I had no intention of buying anything. It is truly
amazing to see the amount of radio equipment and operators there. Many new
products are released at Dayton and you usually are able to play with them!

Greg,

Sounds like the radios are synthesized. The MTSX series is fairly new, and is programmable to the extend that they don't even label the programmable buttons (because you can set them to do almost anything like scan, low pwr, monitor, Tx PL Strip, etc.) You won't be able to determine the exact radio frequency from the outside. You need a computer.

HOWEVER, if you are looking to monitor the transmissions on a scanner, you can determine the band by the radio (antenna length), and then scan the blocks of freqs assigned to the general business class within the band. For example, if the radios were UHF, I would first try scanning in the 460-470 range. I'm not clear on the business bands for VHF Hi-band or 800/900.

Good Luck.

I don't mean to play Devil's Advocate here, but you really never said what
you were going to do with the data. Are you going to post all the information
you receive on your free public web site? You could just as easily gather a
huge database of heard frequencies and the sell it or allow access only to
subscribers... Just had to throw that in, I look forward to seeing the site
and the opportunity to add my Portland, Oregon collection...

I saved this a while back...glad I did!
Oakland city is on trunk in the 800'sm good luck
CHP is in 42 to 43 .... 42.92 and 154.904 will get you started.
Have a great time

From: msattler@netcom.com (Michael Sattler)
Subject: SF PD miscellany
Date: Tue, 15 Mar 1994 06:50:05 GMT

The following information was received today (13 Mar 94) via
FAX from the San Francisco Police Department Communications
section. All errors are my own.

Police stations:
A - Central
B - Southern
C - Potrero
D - Mission
E - Northern
F - Park
G - Richmond
H - Ingleside
I - Taraval
J - Tenderloin Task Force

Police Frequencies:
PIC #1 460.225 G, H, I
PIC #2 460.125 C, D
PIC #3 460.500 A, B, J
PIC #4 460.075 E, F
PIC #5 460.450 tow desk
PIC #6 460.350 admin
PIC #7 460.525 PT&T (Parking, Traffic & Tickets)
PIC #8 460.550 traffic, MUNI, narcs, vice
PIC #9 460.025 RCLEMARSS

Note: portable UHF radios transmit 5 mhz higher on all duplex
frequencies (PIC #1 through #9)

Police Unit Designators:
1 - administrative
2 - technical services
3 - patrol
4 - special operations

5 - investigations

Units are referred to as R[designator][station][sector],S as
in 3B40.

San Francisco Police Department
Radio Code

-=> Quoting Harald@vestnett.no to All <=-

Ha> I am looking for an alfanumeric scanner. Is there anyone out there
Ha> who can tell me any good solution and perhaps some prices?

Hi, Harald...

Well, there are several...though only Uniden makes them, I believe.
(Maybe AOR, but no knowledge of them.) The 8500 and 9000 XLT units are
base scanners and have the ability to put alphanumeric characters in 250 of
the 500 channels available. They run approx. $400 give or take. If you
decide on one of these, get the 9000. Too many problems with the 8500 and
the bugs were worked out in the 9000 version.

3547. Pro39 crafty tricks

Newsgroup: rec.radio.scanner
Date: 1995-03-18 09:45:55 UTC
From: dpfg@ukc.ac.uk
Message-ID: <6891@rook.ukc.ac.uk>
Source record: 259964

Are there any tricks on the Pro39 to allow 12.5kHz channel spacing
in 68-88 or 137-174, or perhaps more importantly to permit AM reception
in these areas?

Easy things like test modes obtained by pressing buttons are what I
am after.

Are there any test modes at all??

Us> If anyone out there has the frequencies for the Police Department in
Us> Columbus Ohio it would be greatly appreciated if you would pass them
Us> on.

I don't have any freqs for Columbus, but I can give you a tip. There is an organization called ALL OHIO SCANNER CLUB. I believe they may have a BBS, though I don't know what their number would be. A BBS here (since dismantled) used to carry their messages here in Chicago.

There's a lot to complain about when it comes to Rat Shack but I've never had a problem returning stuff or getting a complaint resolved. I'd call the store manager and then his boss--I'me sure you'll get satisfaction.

3554. Re: Police status codes

Newsgroup: rec.radio.scanner
Date: 1995-03-18 11:18:06 UTC
From: dg715@cleveland.Freenet.Edu
Message-ID: <3kefhf$9i8@usenet.INS.CWRU.Edu>
Source record: 259966

There aren't any standard police codes used on radio. Each department can make up its own codes. There are some codes that seem to be used by many departments but, as explained in previous postings, even jurisdictions that share common borders may use the same code phrases to mean different things. For example, at one department where I worked, a 10-99 meant an outstanding warrant had been issued. Across the street, 10-99 meant a bank escort.

Many departments use codes and signals. Generally, a code is a course of action and a signal is a set of circumstances.
Of course, nothing's written in stone.

From: pgunn <pgunn@earthlight.co.nz>
Message-ID: <3keioh$usj@celebrian.otago.ac.nz>
Source record: 259969

I was discussing this with someone the other day, and he told me that the in Europe ppl had been moving to spread spectrum for a while and they had discovered something interesting about having lots of users using it.

He claimed that although the level from anyone transmitter (in this case phones) was small, and below the background, the cumulative effect of having 000s of users in a given area was such that the phones could fail. There is a critical number of users, above which all in that area fail. Eg 400 users fine, 401, all in area die.

Any comments?

3560. Question to all about scanning

Newsgroup: rec.radio.scanner
Date: 1995-03-18 13:10:01 UTC
From: cforrest@netaccess.on.ca
Message-ID: <3kem39$pim@alpha.netaccess.on.ca>
Source record: 259889

Hi everyone,

I am an experienced shortwave listener and have never had a scanner. I'm curious, but I don't really know what I would be getting. I'd really appreciate the input of some people on this newsgroup who have experience with scanning. What sort of things can I expect to pick up with a scanner? I understand there are a lot of unility stations like police and fire, and also some Hams on 2 metres, but what else is out there on scanners? The scanner I am thinking of getting is an RS 2030. The range is from 30 - 960 MHz. I live in the Southern Ontario region.

I would really appreciate your help.

If any of you have any questions about SW stations or which portable SW receiver to buy, I have a fair bit of experience, so could help you out.

Unless you have a valid ham license. If you are a licensed ham, Florida's
law exempts you from any restrictions. FS 843.16 paragraph 3 if anyone wants
to look it up.

Not sure on this one myself, if anyone knows this one I'd like to know the
answer myself.

> KENTUCKY..... YES..... NO ..... NOT SURE
> NEBRASKA..... YES..... Y/N**.... NOT SURE
> NEW YORK..... YES..... NO ..... NOT SURE
> OKLAHOMA..... YES..... Y/N**.... NOT SURE
> VERMONT..... YES..... Y/N**.... NOT SURE

For all of these the answer is "yes" as of 1992. Kentucky was the last to
exempt hams. Please note though, that atleast one state (and I'm sorry to
say that off the top of my head I can't remember which one) only exempts hams
with a license of Technician or higher. If you only hold a Novice license,
you're not exempt in that particular state. If no one posts the name of the
winning state before Monday, I'll try to look it up during the coming week.

And incidently, nice chart, thanks for posting it!

>which I might otherwise miss out on, etc. etc.

Several possibilities come to mind; I'm sure others will find more:

1. The RF circuitry has poor (or no) sensitivity in that range, or the PLL
is incapable of locking in that range at all.
2. The set is engineered so that all the birdies fall in that range,
making it unuseable for reception.
3. Covering that range would require the inclusion of demodulation and
bandwidths the receiver is not designed for (e.g. wide FM)
4. The frequency range may be illegal in another country in which the
radio is marketed, and the manufacturer didn't bother to write the
firmware in such a way that some frequency ranges are optional.

Does anybody have the instructions or can point me to a site with instructions for the Regency Touch M100 scanner. This is a 10 channel scanner from a police car that I use for local police (I have two other scanners for other use). I would appreciate any information about the operation of this radio, it was purchased at a ham flea market for $35 and still works fine but, alas, no operation manual (or mods).

Michael

3569. General post advice

Newsgroup: rec.radio.scanner
Date: 1995-03-18 17:57:48 UTC
From: Tommy the Tourist <nobody@csua.berkeley.edu>
Message-ID: <3kf6us$6k7@agate.berkeley.edu>
Source record: 259886

I'd like to offer some advice to posters of r.r.s. If you don't already, please put pertinant info into your subject: line of your header it'd surely be appreciated by some newsgroup readers. Generally the subject line determines if I even read an article. When I see posted "PRO-99 mod" I expect the article to tell what kind of modification someone's come across only to see someone requesting a mod for full 800MHz scanning ability. A better title might be "PRO-99 800MHz mod?" or "Any PRO-99 mods?"

I don't mean to get on anyone's case, but more thoughtful and descriptive subjects would help make the reading less frustrating, and it might even get your post read by that one person who has the answer to your question!

Food for thought. Best wishes!

```
Hey all. I just purchased a rat shack Pro-51 handheld. It is stamped
with "11A4" on the little sticker on the back. I am looking for any mods
for this scanner that will work with this particular revision. I don't
mind the beep(i.e. the no-beep mod won't help me) but I am looking to
pick up more of the 800MHz band and 700MHz. I tried a mod for an older
version of this scanner, but it didn't do what I wanted it to. Any tech
info on this scanner is greatly needed. I am also looking for info on a
Bearcat 210 base station/mobile. I checked out the net/web for the
pro-51 and found mods for every darn scanner except this on. I have the
link to the place where I found the other rat shack scanners, check it out.

Actually any of the alkaline rejuvenators (Buddy-L, Innovations,
Remington, ECCO, etc) will recharge them ... but not to full capacity.

I pulled this out of the Denver paper shortly before DIA opened.
I tried these out yesterday and they seem to be accurate, although
some of the freqs were rounded. Also the article said that some freqs
may be dropped and combined as time goes on. Happy listening.

ATIS: 134.02
Outbound flight taxi instructions: 118.75

Control Tower freqs by runway:
8/26 and 17L/35R: 123.3
17R/35L: 132.35
7/25: 133.3
16/34: 135.3

Ground Control freqs by runway:
8/26, 17R/35L, 17L/35R: 121.85
7/25: 127.05
16/34: 128.75

Ramp control:
Concourse A: 129.02
Concourse B (North side): 131.07
Concourse B (South side): 129.5
Concourse C: 129.85
Cargo Ramp: 131.97

Departure:
North: 127.05
East & South: 128.25
West & South: 126.1

Approach:
Distand fixes to landing pattern:
118.975, 119.3, 120.35
Final approach:
120.8, 123.85, 125.75

>communicate with medical helicopters or at mutual aid scenes.

Bzzzzzt. 154.280 is used locally by the Medical Center of Delaware for communicating with their disaster response team, among other uses. All of the volunteer fire companies have low band radios (33.78 MHz primary) - some have private UHF systems, also. The City of Wilmington uses an 800 MHz trunked system. NONE of them have 154.280 licensed.

I don't know of any National fire mutual aid frequency, although the Federal Interagency Fire Cache has several channels licensed throughout the country.

Everybody here seems more qualified than I am, so I would appreciate any advice that can be passed along...

I am shopping around for a hand-held, continous band scanner. I've heard good things about the new AOR AR-8000 and the Yupiteru MVT7100. Are these good choices??

Does anyone here have any recommendations? Are these two models top-of-the line? Which is better? Reliability of the AOR, etc? Quality, value for the money, etc? What are good prices for this equipment (I just don't want to be taken)?

Also, the names of a couple of reputable stores with competitive prices would be great as well (preferrably in Canada or UK).

Please respond via e-mail. Any help and advice will be greatly appreciated. Thanks!!!!

Here in CA, 154.280 is known as OES (Office of Emergency Services)
"White 1" . It is used by fire depts for mutual aid, mostly in cases
of neighboring depts. when they roll on something like a T/C together.
There are also two others "White" frequencies that are rarely used.
I'll post them when I find them. (A ten minute search just now failed
to find them)

3586. cell restore on bc890xlt

Newsgroup: rec.radio.scanner
Date: 1995-03-19 00:59:00 UTC
From: dominique.cormann@canrem.com
Message-ID: <60.16138.5773.0N1D6856@canrem.com>
Source record: 259829

Hiya.

I purchased my BC 890xlt about a year or so ago. I used to have an article on how to restore the cellular on it, but I lost the article in the move to Toronto (I am student and live downtown).

Once and while when I listen to the police i can hear some cellular coming through...this is annoying, but I don't think I can do anything about it...can i? I have a magnet mount antenna, and it sits on the balcony of my apt, and I run a cable into the house. This way I don't get RF from the computer...'cause the scanner sits on the computer desk...so I can be a multitasking geeeeek.

Ok back to my question...does anyone remember how to restore cellular, some of the stuff that leaks through is pretty juicy...can anyone help me on this one??

Thanx!

... A feature is a bug that you've found a use for.

You may want to contact the manufacturer of the Pouch the company address is:

The POUCH
535 Suffolk Drive
Tucson, AZ 85704
Phone 800-727-6824

The S2 model should fit the PRO-43 scanner.

Joe

>>

>I'll be going there in a couple of months myself. So I second this
>request for info. Thanx.

Here are the frequencies that may be of interest to you:

Salt Lake City Fire:
154.430 Dispatch (F1)
154.310 Dispatch (F2) (Usually same as F1 but not always)
154.340 (F3) (I never listen to this -- not sure what it is)
154.280 Mutual Aid (F4)

Salt Lake City Police:
460.050 East Side (F1)
460.150 West Side (F2)
460.200 (F3) (Not sure what this is)
460.300 Ten 27s & 8s (F4)
460.375 Car to Car
I believe these five frequencies are repeaters. Control is 5 mhz
above these frequencies

Salt Lake County Sherrif:
154.785 Dispatch (F2)

Utah Highway Patrol:
155.505 Statewide & interagency (F1)
155.580 Salt Lake
460.125 Salt Lake

Gold Cross Ambulance and hospitals:
155.340 463.000 463.025 463.050 463.075 463.000 463.125
463.150 463.175 And 5 mhz above these 463 mhz frequencies

There are many others for various cities in the Salt Lake Valley. If you
have specific interests send me e-mail.

3597. AOR AR2700 REVIEW!!!

Newsgroup: rec.radio.scanner
Date: 1995-03-19 14:45:57 UTC
From: Jeff Goldman <76703.4224@CompuServe.COM>
Message-ID: <3khg36$p9l$1@mhadg.production.compuserve.com>
Source record: 259914

A REVIEW OF THE AOR AR2700 HANDHELD SCANNER by CIS HamNet SysOp Jeff Goldman
****

The AOR AR2700 was unveiled in an ad in the March issue of Shortwave Magazine in England on Wednesday Feb 22, 1995. The scanner itself arrived on Thursday March 9, 1995. This Japanese-made scanner in many ways looks like a Yupiteru, from the shape of its case, buttons and even battery compartment. And the features and slightly simplified AR8000-like programming methods suggest a lower end AR8000, but performance suggests a revised Nissei (ie AR1000/2000).

The AR2700 is roughly US$395 (including 2 day delivery) from Javiation. There's a US$30 optional vinyl case that looks very similar to the one available for the AR8000. And, of course, one can buy a cloning kit. Unfortunately, an extra adapter must be purchased to put onto the end of the cloning kit's ribbon connector - and at the time of this writing, that adapter isn't available. So, we don't even know if cloning from a UK to a US unit will be a Data or SysData transfer (restoring full 800MHz coverage).

There's an optional 20 second voice recording chip that I had installed by AOR UK. It is really neat! There is some internally generated noise that I notice while it's recording (sort of like static), but this is not picked up by the recorder; that is, playback is clear as a bell. You can use the recorder in Manual, Scan or Search modes. The signal strength meter becomes a relative time-elapsed readout while in the Record mode.

In Japan, you can buy a cordless phone descrambler board. From the AR2700's keyboard you can access a Descrambler Menu, as well as activate and deactivate the descrambler.

Like The New Concept AR8000, The New Star AR2700 has an EEPROM for permanent memory retention. That's good because my AR2700 arrived about 2kHz off freq; I can open up the radio to tweak a potentiometer without losing the memories.

This radio covers 500kHz (no built-in ferrite bar) thru 1.3GHz in NFM, WFM or AM modes. The display has indicators for USB and LSB, too, so who knows that other future radio will have this display?!!

In addition to the unique voice recording chip, this scanner boasts a three bar fulltime onscreen battery condition readout, signal strength meter, sleep timer adjustable from 1-120 minutes, 10 banks of 50 channels each, 10 Search banks, and a lamp that stays on either 5 seconds after the last keypress OR permanently.

Available steps are 5, 6.25, 9, 10, 12.5, 20, 25, 30, 50, and 100kHz. (Only 50 and 100kHz selectable when using WFM.)

Audio is clearer than that from an AR8000, though the audio amp isn't as powerful. Also, audio isn't quite as robust as that from the Yupi 7100. And it's a little distorted for some reason on the high end of 800MHz. The radio seems to be reasonably sensitive; unfortunately, the front end is prone to overload. Some audio from a local FM station is heard in the background and one must raise the squelch level to get rid of lots of noise on VHF-Hi when the radio is in a really RF-rich area. (The 10dB per-channel selectable Attenuator tends to take care of these problems.) Also, I receive some 2-way transmissions on the high end of 800MHz where they clearly don't belong.

One thing it has in common with some AR8000s, unfortunately, is a floating birdie. In my AR2700 in the last few days, a birdie that originally cropped up on 162.475 moved to 162.445 and is now on 162.425MHz.

That said, the radio does seem to be much better than older Nissei radios (ie AR1000/2000/Trident TR2400/Camnis HCS-050). True, the AR2700 doesn't have a BFO for SSB/CW like the TR2400/HCS-050 did, but the scan/search speed is 30cps vs the Camnis' 9cps (due to a momentary pause at the end of each bank it scans or series of freqs it searches). And there doesn't seem to be a difference in squelch threshold levels when monitoring 800MHz vs other bands. Also, with the Camnis, when using Priority during a Search, after a transmission on the Priority channel ended the radio would revert to the beginning of the Search bank rather than continuing to listen on the last monitored freq or continuing onward from there. This bug is NOT in the AR2700.

The bottomline is that the AR2700 is definitely a better midrange continuous coverage scanner than many that went before. It is certainly not perfect, nor is it as good as the high end Yupiteru MVT-7100 or AOR AR8000. But, for around 250 British Pounds Sterling (plus voice recording chip), it is quite respectable... plus a lot of fun!

If you'd like more info and have an Internet WWW browser, you can go to Javiation's catalog page where there's a picture and other details on the AR2700. The WWW address is: http://www.demon.co.uk/javiation. The Javiation Internet Email address is: info@javiaton.demon.co.uk (yes, spelled javiaton), and Jonathan Clough's CompuServe UserID is 100117,535. Telephone number (from the USA) is: 011-44-1-274-732146.

Source record: 259919

Yes, the BC2500XLT handheld receives 800 MHz, but it has been replaced by the BC3000XLT, which has the following freq ranges:

25.000 - 549.9500 MHz 760.000 - 1300.0000 MHz

This is also a handheld, 400 channels. Costs about $400.

From: bodoh@dakota.net
Message-ID: <3khq1p$fr6@westie.mid.net>
Source record: 259921

I notice that the BC3000XLT does not come with a case. I do not like to use radios without a case and am wondering whether the 2500 came with one and whether it would fit. I do not like generic 'pouches' as they are not 'form fitted' as custom ones are and don't have cutouts in the proper places.

Also, I read that the BC9000XLT receives cellular images in the 380 Mhz range. Does the 3000 do this as well? Other general impressions of this radio would be appreciated as well.

Thanks...

Tom, N0YGT

Ds> I have a birdie on my pro-51 that is sitting right on a freq I want to
Ds> listen to very often. How could I kill it without destroying
Ds> reception?

Shoooot it?! <g> Actually, there isn't too much you can do about it. The birdie is possibly the spurious signals from the microprocessor and other digital circuitry. One solution that could work is to program the radio slightly off frequency from the actual. For example, I have a birdie on my 2500 Uniden at 156.000. I programmed my radio for 155.995 and birdie is gone. Give that a try and see if it works...nothing much else to do.

Jerry

>says these scanners lose sensativity over the years. Is this true?

It's more likely that the center pin on the BNC antenna jack is
no longer making contact between your antenna and the scanner
circuitry.

The jack's Y-shaped center contact may have spread apart and no
longer grip the pin on the male BNC plug at base of your antenna.

Also, get a technician to open the radio and make sure the
jack's center pin is still soldered to the radio circuit board.

>impressions of this radio would be appreciated as well.

The BC3000XLT hears cellular phone images clearly starting
at 1005 MHz. It is an excellent portable which scans and searches
blazingly fast and has good quality. You can program the attenuator
and delay for each of the 400 channels. Like the BC9000XLT,
it has a fast, intelligent Auto Store feature.

The BC3000XLT is well behaved in strong signal areas, a large
improvement over the BC2500XLT. I was so impressed with the
BC3000XLT that I bought one for myself from The Ham Station
to replace a trustworthy PRO-43.

By experimentation, I found several undocumented features "hidden"
in the BC3000XLT. Watch for my BC3000XLT review, which includes
tips for "liberating" them, in the April 1995 issue of Monitoring Times.

Anyone have any experience with GPS receivers? I am interested in the Icom GP-22 as I have numerous pieces of Icom ham gear and I think they build quality equipment.

For those not in the know, GPS stands for global positioning system, and it uses satellites rather than ground based transmitters such as for loran.

Hi Tom,

Try the newsgroup "sci.geo.satellite-nav". They are constantly
discussing which small receivers are good and which aren't. Don't
quote me on this, but the Icom does not get high marks in general.
The two that everyone seems enthralled with are the Garmin GPS-45
and the Eagle AccuNav Sport. Both are in the $300-$400 range.

If anyone has a source for Motorola Visars or Sabers (Astros)
I'd like to hear about it.
The dealers in my area don't carry any used radios. The going price for
used Sabers mailorder is $1300. and up.

Any ideas?

Thanks.

I have an alarm system by Ademco which utilizes wireless transmitters for door switches and a wireless keypad. The wireless keypad has an antenna which looks to be about 2 1/2 inches tall. I tried to use a frequency counter to determine the frequency of the transmitter, but cannot get a good reading. The transmissions are either too short or the cellular site outside overpowers the counter.

If anyone knows the frequency (or a range) that I might try receiving these transmitters on, please send email.

Stephen Wassell says:

" I've been trying, without much success to get some sort of picture from
" the strong signal at 137.925Mhz. I guess that it's a weather satellite,
" as that's what is sounds like, but I can't get any sort of picture.

" I'm using JVFax 5.1 on a 486/66, with a hamcomm interface. The interface
" definately works, but when it's all connected up I just get at best a
" black screen with occasional white dots.

" What's going wrong here?

You didn't mention what kind of receiver you were using. If you're using
a standard scanner with 5 Khz bandwidth *that* could be the problem. 40
Khz works better. An inexpensive mod is described in Satellite Times,
Vol. 1, No.4, Mar/Apr 1995, pg 84. The author describes modifying a
Bearcat 210 (circa 1977) for APT reception.

While I realize that the above mentioned unit is probably not a "real" scanner, I was wondering if anyone had any experience with the "Beartracker" and whether it lives up to it's advertisement that it keys off if there is a patrol unit within a 3 mile radius from the device. I'm looking at it more from the convenience of having all the scanner frequencies already pre-programmed in it by state and wonder exactly how comprehensive this is. Any experience or views on this would be appreciated.

Bill,

Before you go out on a limb and include ALL states you really should have
a copy of all state laws.

In Michigan the law reads as such:
MCL750.508

Sec. 508
Any person who shall equip a vehicle with a radio receiving set that will
receive signals sent on frequencies assigned by the Federal
Communications Commission of the United States of America for police
purposes, or use the same in this state unless such vehicle is used or
owned by a peace officer or a bona fide amateur radio operator holding a
technician class, general, advanced or extra class license issued by the
federal communications commission, without first securing a permit to do
so from the director of the department of state police upon application
as he or she may prescribe, shall be guilty of a misdemeanor, punishable
by imprisonment in the county jail for not more than 1 year, or by a fine
of not more than $500.00, or by both fine and imprisonment in the

discretion of the court.
(2) This section shall not be construed as resrticting the use of radar detectors.

As you can see you may carry a scanner in Michigan if you are a Licensed Ham of Tech or above.

The above was quoted from the state law and a letter I received from The division Commander of Communications of the state of Michigan.

Also many states allow anyone to carry a scanner and use it in the vehicle. Two I know of are Ohio and Ca.

The Police Call for $9.95 is your best bet.
But here are a few for starters.
Oakland County Sheriff
851.0625
851.4625
852.0625
852.2125
852.4625
853.4625
854.0625
854.4625
855.0625
855.4625
Do not set a delay on the above channels since they are trunked.
Instead of typing a lot of information about trunked radio systems you'll
get a really good explanation when you pick up a copy of Police Call.

: BS> any other transmitting equipment does constitute a transceiver.
: BS> No one has tried that, yet I've not heard of anyone having to use
: BS> the FCC preemption yet as those states with the problem laws all
: BS> exempt hams completely.

: While the argument could be made, the FCC has specifically stated that it
: will not listen to the argument.

I'll be the first to admit that I don't have access to everything
the FCC posts/publishes, so would you please specify where the FCC
has made that statement?

The actual FCC notice contained no definition of what a transceiver
must be.

: The FCC does not consider scanners to be HAM equipment. At all.

Again, where has the FCC made that judgement. Can I presume then that
an R-5000 commercial receiver with a separate transmitter isn't ham
gear either?

: Also, there are several localities that ban scanners. And, a state that has
: a ban on such equipment in vehicles is not affected by the FCC action, as
: far as scanners are concerned. Only HAM gear.

None of the state regulations specifically identify scanners....they all
use generic descriptions along the lines of: "radio receivers which
can receive police broadcasts..."

Additionally the few states with bans on receivers in automobiles
all currntly exempt hams
catagorically without any reference to any specific equipment being used.

: cover scanners?
: Bill Funk

Your comments point out how simple it really isn't. That's what judges
and juries become the final arbitors of.

Certainly the FCC action was rimarily targeted towards ham equipment
(transcievers) that included some non-ham coverage, but the FCC put
no limit on how much non-ham coverage either. Could a cop or
prosecutor make a claim that an ICOM 2SRA (2 meter FM with25MHz to
1300MHz receive) was more of a scanner than a transceiver if they
wanted too?

>bbaker@csn.net

Yes, Ben. Delta Air Lines allows "VHF Scanning Receivers" to be used now while airborne. Of coures users must follow the other rules too (about stowing it for takeoff and landing and (I think) not using it below 10,000 ft.

I have used mine twice amd been "caught" by the Stewardii both times. They tried to make me put it away. I pointed out to them in their in-flight Mag where it says they are allowed. She took the mag up to the Captain and came back with a sheepish look on her face.

She said something to the effect of : "Sorry, go ahead and use it. They did not tell us of the change. We were taught that 'if it has an antenna, its not allowed'."

As I understand it, they are involved in a test to see if these devices interfere with nav gear on board.

Ant BTW- as I used the scanner, the plane did no nose-dives nor did it assume any strange attitudes and it didn't crash, either . :)

Bob,

What type of plane were you on? I took my Pro-43 on board a B-727 and
all I could get was an occasional transmission for the aircraft to
ground.

I would think that reception inside the cabin would be very poor cause
after all you are inclosed in a metal tube. Seems that it would be
better if you would hold the scanner up to the window but then you
would be obvious.

Subject: "Kenneth" Dan Rather Mystery Solved?
From: athena@tyrell.net (athena)
Date: Wed, 9 Nov 1994 17:57:35 GMT
Message-ID: <Cz0Hw0.B44@tyrell.net>

In the Nov. 7 issue of New York magazine, a guy who thinks he may be the real "Kenneth" comes forward to offer a possible solution to the 1986 Dan Rather "Hey Kenneth, What's the Frequency" mystery.

On October 4, 1986, Dan Rather claimed he was attacked on Park Avenue in New York by two well-dressed thugs who pummeled him about the head and kept repeating, "What's the frequency, Kenneth?" Rather has been the butt of countless "Kenneth" jokes ever since.

Now a Ken Schaffer, a Manhattan electronics expert, comes forward to say he thinks the attackers may have meant to follow him home from Columbia University's Harriman Institute for the Advanced Study of the Soviet Union,
and mistakenly followed Rather instead.

In 1986, says Ken Schaffer, both he and Rather were frequent visitors at the Harriman Institute. Rather, because he was about to go to Iceland to cover the Reagan-Gorbachev summit; and Schaffer, because in 1983 he had begun receiving fuzzy images of Russian TV on his amateur satellite getup.

(Schaffer was also the inventor of the wireless electric guitar in his late twenties, and the article claims he was a skilled ham-radio operator since age 8.)

"Within a year," says the article, Schaffer "developed a system that would track and decode the signal and filter out the city's microwave interference, all of which the satellite experts said couldn't be done."

"By 1985, Columbia students and journalists...could peer into Russian's everyday lives. (Even one of Schaffer's musical pals, Sting, spent an evening at the school watchin g a Moscow production of Porgy and Bess. Deeply moved by the experience, he composed his song "Russians" the same night.)

"Schaffer theorizes that intelligence operatives followed the wrong man--Rather instead of him--home from the Harriman institute."

Schaffer does not claim to know whether the operatives were KGB, CIA, or what.

If Ken Schaffer is on the Net, I hope he will join the discussion. I hope I have been faithful to the article, which is on p. 24 of the Nov. 7, 1994, issue of New York. Please don't get this mixed up with the New Yorker...they are different magazines. This explanation makes sense to me,
and I have always found the "Kenneth" mystery intriguing.

Schaffer says he hasn't talked to the media about this before, because they weren't much interested. "I'm as much an observer of the idea as I am a proponent of it," Schaffer says.

If you pick up a Ramsey LPA-1 kit(or they have it pre-assembled), this
will give you a major boost..about 1 watt out.
This should give you the range you need.

Why is a microphone needed?...
Remember that the tuning fork is METAL...so it will reflect enough of the signal back to the unit.
Since the tuning fork is vibrating(you have to STRIKE it first), the reflected signal will vary at the frequency of the tuning fork.
As this frequency is known, all that has to be done is to look for a certain speed on the display.
Either its correct, or the radar gun goes in for recalibration.

I have a PRO-43 and a RS Discone on the roof, I use to roof antenna to enhance my reception of military aircraft and other weak signals. I use the stock rubber antenna for the local fire, police and other strong signals. I can't use the discone for VHF-HI band because of intermod. from a local cab Co. and a paging transmitter, both only one block away. I think the addition of the discone was well worth the money and the time. Thanks, Steve Ralston Escondido, CA.

I think you are beeing too hard on yourself.

I must have missed the messages that gave you a bad time about posting the
scanner law chart, but I think this would be useful to many people. I see
messages almost every day from people who want to know what is legal and what
is not in the different states.

If it was the people in other countries that complained about the world
distribution of information, then just choose USA for distribution next time.
There is tons of traffic that gets world distribution that should be USA only.
To single your posting out is a bit rediculous. Besides, people comming to
the USA from other countries with their scanners may need this info.

: with a scanner? I understand there are a lot of unility stations like
: police and fire, and also some Hams on 2 metres, but what else is out
: there on scanners? The scanner I am thinking of getting is an RS 2030.
: The range is from 30 - 960 MHz. I live in the Southern Ontario region.

: I would really appreciate your help.
Hi Chris!
Hello to a fellow SWLer, as well. Scanning is great. I live in the NYC
metro area. So sometimes, even a 400 channel scanner is not sufficient.
In some parts of the US, a fifty channel scanner may do just as well.
I'm sure that the same applies to your area.
Go to your local library and see if you can find copies of Monitoring Times
and Popular Communications. They both have excellent scanning articles,
SWL too!
Possible services to hear are:
Public utilities - electric, telephone
Taxis, oil companies, cordless phones, air phones, paging systems
Weather stations, Ham radio, government, ambulance, police, coast guard,
commercial fishing, rail road, TV and radio comms, construction crews
Satellite and spacecraft..... and the list goes on.
Good luck and good listening!
Dave HInes N2LAK

I think this comment was aimed at the issue of national security more than
anything. I do not think it would be proper to post real-time movements of
the military on the internet. Even with limited distribution, other countries
can just use dialup access to get messages with USA distribution.

Yes, Pocsag and Golay are pager standards.

One advantage the 440 has over the 400, is that the 400 only has a parallel port to send the data out to your printer. There isn't an easy way to feed the data to your computer. OTOH, the 440 has a serial connection to feed to your computer (although it is TTL output, so a converter is needed).
Most of the other modes, excluding ACARS, is for the shortwave bands, and I doubt the AR8000 would produce very good results in these modes. ACARS is used for VHF aircraft communications (although you probably won't see too much exciting on the ACARS communications).

Another advantage is that scanner control software like ScanStar, which will control the AR8000, can also control the 440.

A pragmatic view would be to get the DC440 since pagers and ACARS are boring, and you may never use the other modes on the shortwave bands.

>
>Thomas P. Skinner
>W1GAB
>

I have an ICOM GP-22. It lied to me in the Colorado high country and
it took us (my 25 yr. old son and I) 3 days to find the truck.
I have talked to Icom service and they claim that I should have
done an "almanac" in the location that I was using the receiver.
According to the instructions, accuracy is not why one does an
almanac. There is an outfit in Kansas whose name I've forgotten
but it's something like Cerwin, who has been working with the
FAA on putting GPS into aircraft. They have what LOOKS like a
much better receiver. Their product is advertised in the latest
Cabellas catalog. They use an 8 channel receiver and there is a
display mode that shows signal strengths. I think my problem
was due to multi-path distortion, but I can't prove it. I tested
the receiver in another location (still in the mountains) and when
I moved 50 feet, it told me that I had moved 8 miles.

I'm going to forget that I paid $750 for the ICOM and go buy one
of the new ones ($499 I think) before I stray too far from a
marked trail, or stream bed, again.

3661. Pro-41 Mods?

Newsgroup: rec.radio.scanner
Date: 1995-03-20 17:05:10 UTC
From: blshaw@lamar.ColoState.EDU
Message-ID: <3kkck6$38rl@lamar.ColoState.EDU>
Source record: 259777

Hello all. I posted this question about a month ago, but received no responses, so I thought I would try again.

I have a Radio Shack Pro-41 that I picked up for $50 as a closeout. It is limited, but it was still a pretty good deal. It is a 10 channel direct entry scanner, with no seek mode (:-().

I have checked the FAQ and the FTP sites, and cannot find any modifications for this particular model. Does anyone know if there are any simple mods that can be made to it? I would like to be able to receive the aircraft band and/or the 800 MHz band.

Any ideas?

I've been very pleased with another similar supplier, Fort Worth Computers.
Their number is 800 433-7283. They have RS scanners and other RS stuff.

3665. BC200xlt updated mod?

Newsgroup: rec.radio.scanner
Date: 1995-03-20 18:55:41 UTC
From: escape@sylvester.cc.utexas.edu
Message-ID: <3kkj3d$bl9@sylvester.cc.utexas.edu>
Source record: 259781

After opening up my BC200xlt and attempting to restore cellular freqs, I was met with the fact that my chip was slightly different than the one in the mod (I believe there is an "A" appended at the end of the serial #) as well as the fact that the components I was supposed to cut were not there, or had been moved. Does anyone have an update to this mod? None of the other mods seemed to help either, the battery extender mod didn't help either, although it looked a lot less different that the cellular mod.

thanks,
mike

Source record: 259785

I have recently used a long wire antenna (actually the same one for SW) and hooked up into the PRO-39 with the alligator clip and the paper clip. The improvement on all the cordless channels were dramatic, I mean dramatic!! However, I am having a problem on some faint signals which are being interfered by other phone on the same channel. Tried rotating the antenna but did not help. Is there any way to build the antenna that has a direction sensitivity? Since I live in the college apartment with 5 apartments nearby, all the channels are busy most of the time.

Thank you in advance.

Bishwa Shrestha, KC7JFV
Laramie, Wyoming.

By "Legal-Ham Mobile Scanners" do you mean ham rigs that can pick up
beyond the ham bands. Or (being a ham) does that mean I can have JUST a
scanner (like a bearcat or something) it my car?

Thanks

Everybody here seems more qualified than I am, so I would appreciate any advice that can be passed along...

I am shopping around for a hand-held, continous band scanner. I've heard good things about the new AOR AR-8000 and the Yupiteru MVT7100.

Does anyone here have any recommendations? Which is better? Reliability of the AOR, etc? Also, what are good prices for this equipment (I just don't want to be taken). Any stores recommended??

Please respond via e-mail. Any info that is passed along will be greatly appreciated!!! Thanks!!

The BANDSAW callsigns are E-3B's from the 552nd AWC, Tinker AFB

>NORTHERN LIGHTS

I show this one as ACC radar intercept in Houston or
NE Air Intercept Cround Cntl, Tyndall AFB, FL
though neither one makes much sense for where you heard it. Do you
have any more info?

At the time, NORTHERN LIGHTS and BANDSAW OMEGA were working
each other on 364.2 MHz. This bears out the likelihood that I was
hearing NORAD traffic.

Also, the NE NORAD center is at Griffiss AFB in Rome, NY.

Since I live in the college apartment with >5 apartments nearby, all the channels are busy most of the time.

An option that works nice on low band is the VHF dipole that RS sells for TV sets (15-235 on page 104 of 1995 catalog). You can get the 300 to 75 ohm adapter (15-1253 on page 107) and the F to BNC adapter (278-251 on page 109) and you're in business. The antenna opens up to 8 feet (about 65 MHz wavelength) and works great for the 30-54 band. You can shorten the dipole length for higher freqs. I've found it to be VERY directional on VHF freqs and useful for direction finding on those interesting cordless freqs :-)

I have 2 iggies, a (presumed) male Jimmy - 6"SVL and Lizzie a (presumed) female - 4"SVL.Lizzie has very small spines and a rounder face, which makes her look much younger that Jim.

I mentioned here a while back that Lizzie didn't seem to be growing as fast as Jim and someone suggested that Jim was hogging the food dish.

I set up my camcorder to watch them. I ran a cable to my VCR so I could see what happened for 6 hours.

The first day, Jim popped by and ate several times and spent a lot of time looking over the edge of the shelf (probably at the cats - they like to watch the iggies). No sign of Lizzie during those 6 hours (7 AM to 1 PM).

The second day, Jim did serious head bobbing with dewlap exposed - any time Lizzie came near the food. Chased her off twice and bit her tail once.

We put Lizzie in her own cage.

Now come the questions:

I assume that head bobbing is a male thing. Would they be more likely to do this to another male than to a female?

When Lizzie gets bigger, what would the prospects be of re-uniting them?

Dishheads, dishheads, roly poly dishheads!

>whatever, they could reach Chicago from Minneapolis on a good day.

Your theory is correct that the plane's crusing altitude allows him to
hear that plane but not hear the Denver airport some 200 miles away.

However, he'd actually need an antenna at the top of a 20,000 foot
tower to be able to hear the Denver airport 200 miles away. (I realize
that your 900 foot tower was probably for illustrative purposes rather
than as a precise figure.)

The approximate air-gnd vhf comms ranges for various cruising
altitudes are:

1,000 feet = 45 miles
5,000 feet = 100 miles
10,000 feet = 142 miles
20,000 feet = 200 miles
30,000 feet = 245 miles
40,000 feet = 285 miles

Those ranges are in all directions from the aircraft and conversely in
all directions from your location.

The formula is: Distance (in miles) = the square route of the plane's
altitude x 1.42.

Message-ID: <25229MULEXVUOBYNRVI@inferno.com>
Source record: 259814

IG>Where I work, they use some Motorola handhelds to communicate.
IG>Our security, MIS, and sometimes janitors (!) use these radios. What
IG>range should I search to try and find these? I only have a little info.
IG>on the radios. They are Motorolas. They have the letters 'MTX' printed
IG>on them. At the top there is a rotary dial, as well as an A-B-C toggle.
IG>Does the A-B-C toggle indicate each radio can communicate on one of three
IG>channels? (Someone once told me there are 11 frequencies allocated to our
IG>company...maybe MIS for a few, security for a few, etc.)
IG>Is there a common set of ranges for these types of radios? Or are they
IG>programmable, so it's wide open.....?
IG>Thanks.

the mtx series handhelds by motorola are trunking rigs if i recall
correctly. they're probably in the 800MHz range, and your best bet
would be to scan somewhere between 850-870MHz in 12.5kHz increments.
the 11 channels said to be allocated to your company sounds like quite a
few, especially for a trunking system. there's probably 11 "groups" or
"fleets" assigned, which are just call groups for each different
division of your company that uses the rigs. if it's trunked, good luck
listening to the frequency-hopping conversations.

: " definately works, but when it's all connected up I just get at best a
: " black screen with occasional white dots.

: " What's going wrong here?

I bought a program for about $75 called AEA Fax II which I have used for
the past year. It comes with software and a device that plugs into the
RS-232C port of your serial card. It has a wire that comes off of it to
plug into a shortwave radio which you can decode the following:
WEFAX (b/w satellite images)
RTTY (radio teletype)
CW (morse code)
NAVTEX(some kind of offshore weather stuff like RTTY, dont know for sure)

and I think that's it. AEA already has out their new version of that
called AEA FAX III that is basically the same as II, has the same decoder
and all, but will enhance your b/w pictures with color so you will have
false color images of the satellite pics that you recieve. It's well
worth the money.

The most common freq's to find the WEFAX stuff on is 8080 Khz or 9090
Khz. There are several others, but those are the main ones. (not to
mention the only ones that come to mind) :)

Consider getting it, it's the best wefax decoder I've used yet.

Rob

3702. Universal M400

Can anyone tell me the way to convert the pager ID displayed on the M400 to the actual cap code? I seem to remember seeing a posting here not too long ago on this subject but since I don't have a M400 I didn't take note. However a friend now has one and he is looking for the info.

Thanks

>what the correct freq's are?
>--

Typically, the frequencies increment by 1 MHz. So if one of the frequencies is 864.2375, you should check 865.2375 and /or 863.2375. Program about 5 or 10 in each direction and you might be able to find them. You could also use a frequency counter to measure the input frequency and then add 45 MHz to get the output frequency.

Also depending on the size of your company, it might show up in the FCC database. If the system is leased, the license name would be under someone elses name.

I maintain the callsign list for Steve Douglass who publishes the
Intercepts Newsletter. The list is about 2400 callsigns long. I
would send it to you, but it is the property of Steve.

If you are interested in buying the callsign issue or subscribing
to the newsletter, here is all the dope:

Steve Douglass
Intercepts
PO Box 7176
Amarillo, TX 79114-7176

The newsletter is very good and well worth the subscription price.
It is 6 pages long (both sides of 3 sheets) on 8 1/2 x 14 paper. The
price is $18 per year if you get it in before April 1st. After that

the price is going up to $20. Back issues are usually $3.00 each (include a SASE - a legal sized one). I'm not sure what Steve will charge for the callsign issue because it is twice as big as the regular ones. You can contact Steve and ask him about it if you are interested. His email address is: STEVE1957@AOL.COM.
Sometimes he is pretty slow at responding to email. He also writes for Popular Science and is very busy. If you contact him, tell him I sent you. (Prices will vary for international mailings.)

Before I get flamed, I am an unpaid, volunteer member of the Intercepts staff. I have absolutely no interest in rather you subscribe or not. If anyone has any questions about particular callsigns or bases, I will try to answer.

Also, if you can give me any info about any callsigns, aircraft, and the base they are assigned to, I would really appreciate it. The callsign list we have is from scanner listener's input We do not ask for anything that is classified or sensitive. What we are after is the routine callsigns assignged to aircraft at their home bases. For example: CORVETTE F-16 388th FW, Hill AFB, Utah

Regards,

-Gary

: are being interfered by other phone on the same channel. Tried rotating
: the antenna but did not help. Is there any way to build the antenna that
: has a direction sensitivity? Since I live in the college apartment with
: 5 apartments nearby, all the channels are busy most of the time.

You can make 2 horizontal dipoles and switch between them. Each leg of
each antenna should be 5 feet long. You can use very thin wire - magnet
wire if you want to be less conspicuous. You lose some signal with the
horizontal antennas, but you gain a lot in selectivity of signals.

Just get coax with a braid (instead of foil) in it and hook one wire of
the dipole to the center conductor and the other wire to the shield. Add
an F connector on the other end - if it doesn't already have one - and
add an F to BNC adapter.

Another way to make a dipole is get some zip cord (like is used for
extension cords) and split 5 feet of it apart. Run the rest to your
radio and add the proper connectors.

To the best of my knowledge there are no mods for the keyboard, except for the use of the LOCK/UNLOCK. There is an additional mod for the 68 to 88 Mhz, covering TV channels 2 thru 6 (Ch#4 might be in there somewhere for sound). There is an area withing the said band for some voice communications, but most of it seems to be paging and data transmitions.

If you have any questions regarding scanner mods or related, you may reach me thru the TSCNET and it's Seattle number, even though the system resides over here in Kitsap County. The number is 1-206-223-9361 with direct access to this and other scanner conferences.

I just bought a 12 volt DC cig-lighter plug for my car so I
can run my base scanner (pro-2030) on the road. It works great but Im
scared I might harm the scanner doing this.

Could one of you electro-guru's put my mind at ease ?

The base transformer says 12 v DC 500 mAmps
The Car plug says 12 v DC 2Amps

The polarity is correct both plugs are center positive -C 0+

The book with the scanner talks about not using enough Amps could
damage the scanner, with 500mAmps at home and 2 amps in the car this
seems okay, right ???

thanks
tim

If your scanner only requires 500mA (.5 amps) and the adaptor can supply 2 Amps then you are fine. With current, as long as the current source is the same or bigger than the device drawing the current you are fine. Current is not "forced" to the device, the device will just draw what it needs.

With voltage, on the other hand you have to be more careful. Most 12v devices will accept a range anywhere from about 10 to 16 volts, which is important because a cars electrical system can vary by this same range (well, obviously it can go down to zero).

The only thing I would suggest to be on the safe side is to either make sure you have a regulated adaptor, or do not leave scanner ON when you start the car (this is when the voltage can get up to 16v).

Source record: 259731

Anyone have experience using freq-counters to ID frequencies? I'd like to utilize a freq-counter to id freqs when going to events where HT's are in use.

I've tried the Rat-shack counter but it's not of much use for this. Apparently it's not sensitive enough. It won't lock on a 3 watt cell phone until you're within 10 or 20 feet and it won't lock on to my portable phone more than three inches away! Maybe that should be expected at such low power though.

Am I asking too much of a freq-counter? I've read the review (in MT I think) on the Scout but geez!, it's $450! It ought to work! Anyone ever used the Startek counters? If so, how well do they work? And what does the Auto trigger and Hold feature do?

Thanks in Advance.

Bill Funk is the most accurate here but still not 100%. An *unmodulated*
carrier is transmitted at the target. That signal is Doppler shifted by
the moving target and returns to the source. Back at the source, it is
mixed with the transmitting signal (with no Doppler shift) to get a
difference frequency. This difference frequency corresponds to the
Doppler shift and is proportional to the speed of the target.

>> For a car in motion the gun sends out 2 pulses, one a little off to the
>> side of the car to bounce of a stationary object on the side of the
road

>> bounces off the target car and that doppler shift and the one from the
>> cop car are mathmatically figured to determine the target car speed.

Not true. The moving source emits a single carrier. Some of that signal
is reflected by stationary objects and some of that signal is reflected
by the target. Because each of those items is moving at different
relative speeds, two different Doppler-shifted signals are reflected.
The source again mixes the reflected signals with the transmitted
signal to get the difference frequencies. A little signal analysis
determines the difference between the two speeds to get the speed
of the target.

bill.funk@iotp.com (BILL FUNK) writes:
>The second signal is directed downwards to the road surface; it uses doppler

Again, there is only one signal, but it takes two paths (see description above).

>> Just what I have found out in my 7 years of being a radar tech. Which

>> be a cop. Oh well.

You must have been a radar tech in the military or maritime because you don't know squat about how police radar works. I've found that cops generally know very little about how the gun works; they are very likely to contradict themselves in court because they have many mis-conceptions. Despite this, defendants are usually at a disadvantage because the judge believes the cop whether he is correct or not. It appears that my tax dollars are being wasted once again. I hope you know more about law enforcement than police radar.

The problem with this is that the Federal rules are pre-emptive, and the
states cannot enforce more restrictive laws. What I said before stands.

: What exactly do they mean by cell, base and mobile, what is the difference
: between them ???

Good Question sine there are only Base and Mobile frequencies. Base the
radio frequency from the Cell cite to the Mobile Cell Phone or Hend Held
Cell phone. The mobile frequency is the channel from the Cell Phone to
the Cell Site (Base). Generaly these Mobile channel is 45Mhz higher
than the Base.

I am considering purchasing a Radio Shack PRO-2036 scanner. I currently have a PRO-2006 and have been very happy with it, but I have the "itch" to buy another scanner for home use.

I like the new features on the 2036, including 100 cps scan/search rate, rotary tuning, multiple priority channels, and CTCSS decoder option (which I would buy). I have considered the 2035, but it scans at 50 cps, doesn't have the CTCSS option and its 100 channels per bank seem to be too much of a good thing. I assume that both models are NOT modifiable for expanded 800 MHz. BTW, Radio Shack's 1995 cat has incorrect freq info for the 2036. The 216-380 MHz range, which the scanner receives, is not indicated in the catalog!

Anybody using either of these two models have any experiences or comments, PRO or con? (pun intended) :-)

For a copy of the relevant FAA rule (FAR 91.21) and the published policies of four airlines, download:

ftp://oak.oakland.edu | CompuServe
/pub/hamradio/docs/misc | Hamnet Lib 2
scan.airline | AIRLNE.TXT

Delta and ASA specifically allow "VHF scanner receivers" during the cruise portion of the flight. United's list of Personal Electronic Devices (PEDs) that are allowed above 10,000' does not include any receivers. American's statement directly forbids radios at all times.

If anyone has the published policy of other airlines or can provide a contact address, it would be appreciated. Out of a dozen airlines queried, these were the only ones that responded (Southwest acknowledged receipt, but there's been no followup).

That setup won't hurt at all. As far as my limited electronics knowledge goes, those figures are the maximum draw that a device (for amps) can't pull before causing damage to either the cord or the transformer. Amp is another way of stating current draw (I think..). They were probably right in saying that a power supply that is rated less than 500 mAmps could damage the scanner, but I'm not sure.

3736. BC-XLT100 HELP, DOSEN'T WORK

Newsgroup: rec.radio.scanner
Date: 1995-03-22 02:19:49 UTC
From: cgf0@Lehigh.EDU
Message-ID: <3ko1g5$12e8@ns3-1.CC.Lehigh.EDU>
Source record: 259756

I have a BC-100XLT handheld that I haven't used for about six months. It was sitting on the shelf with the battery pack connected the whole time. When I recently went to use it, the darn thing wouldn't work. I plugged it in to the ac adaptor and turned it on. It had held all the programmed frequencies and started scanning on all banks. That's about all it does. All the keypad functions are working with the exception of the "light". I can get no noise at all when rotating the squelch knob. When I hit the "weather button" it scans the 162 mhz range but does not stop on the local active frequency. The unit was fine when I last used it, it's never been dropped or abused. Any experts out there that can diagnose the problem from this description? I reset the memory using the keypad sequence, and reprogrammed it but it is still in the same state. Are there any other keypad codes that might be used to correct the problem, or does it sound like a repair job is needed? Any suggestions would be greatly appreciated.

>would buy)....

I recommend you avoid the PRO-2036. It is the same radio as the
Uniden/Bearcat 890XLT with a different, less legible paint scheme
on the front panel. Also, the squelch control works in the opposite
direction to match other Radio Shack models.

I've used the PRO-2036 side by side with a BC890XLT and other
scanners recently. The PRO-2036 (and its BC890XLT twin) were
severely hampered by images, overload, and intermod. The units I
evaluated had more birdies than a pet shop. The 406-420 MHz band
was littered with TV station audio. Cellular phone signals mixed
with a data channel and wiped out reception almost almost entirely in
the 850-870 MHz band, even using the 19" whip antenna. Paging
was everywhere. All this is in addition to the normal
21.6 MHz image problems inherent in a conventional superhet.

Though it lacks CTCSS and a tuning knob, the newer, 100 channel
dual conversion Bearcat BC860XLT works better and is considerably
less expensive.

Yes, the PRO-2036 does have some attractive features, but the
rescan delay is not one of them. It is either on or off for all
channels, i.e. it is a global parameter, and a throwback to scanners
of 20 years ago. Two frequency simplex and trunked systems are
best scanned with the rescan delay off. Single frequency systems are
best scanned with the rescan delay on. Therefore, the PRO-2036/BC890XLT
cannot scan both types of systems optimally at the same time.

Yes, the PRO-2036 covers the military air band, but because
the mode is fixed at AM there, it will not receive military satellites.
Neither will it tune many ham repeaters in the 222-225 MHz band
because the PRO-2036 step sizes are 12.5 and 25 kHz in that range.

If you want a good scanner which supports CTCSS decoding, I recommend
you consider a Uniden/Bearcat BC9000XLT. Although the BC9000XLT
resembles the BC890XLT/PRO-2036 physically, the similarity ends there.
The BC9000XLT is an excellent performer and destined to be a
"PRO-2035-killer."

Bill, The states cannot enforce more restrictive laws? Funny how gun laws in areas of the country are more restrictive then federal law and have been tested in court and upheld. Case in point Morton Grove Ill in which it is illegal for a citizen of that city to own a gun. How about states that had 7 to 14 day waiting periods before the national law was adopted?

I'm not a lwayer and don't claim to be an expert in the area. All I can tell you about Michigan State Law regarding scanners in a motor vehicle is from this letter I received from the Division Commander Communications Division of the Michigan State Police. Since it's on offical State Letterhead and a copy of Michigan Compiled Law Section 750.508 was included, I'd have to trust what it says and disregard your opinion. One in the hand beats two in the bush. Sorry...

Subject: Please post

Please post this to rec.radio.amateur.misc

To Whom It May Concern:

Note the dates!

As it turns out, Gerald Schmitt (ggs@aerie.lanl.gov) bought a 2006 on August 26, 1994, during a 0% Interest, No Payment until 1995 promo. He did have it paid for by January 1995 (in the allotted time). His eloquent letter was dated March 11, 1995, about three months after he had paid the bill. He compalained to the credit depatment on March 13, 1995, two days after accusations. Right or wrong, Radio Shack immediatley reversed the $6.97 that he was upset about. I don't expect Mr. Scmitt to apologize but I wanted to set the record straight - he was taken care of immediately and his letters are out of line. Thank you.

Jay M. Hoffman, Radio Shack 01-8085, 2501 W. Parmer Lane, Ste. 100, Austin, TX, 78727-4223, 512-835-9550, FAX 512-835-9509 Radio Amateur KA5OST, Radio Shack since 1979, Senior Manager, Leaders Club Member.

3-21-95:Gerald Scmitt writes:

Mr Hoffman,

A couple of suggestions for you. Get your facts before accusing anyone. I did not let the contract go past the time limit and thus buy myself some interest. I know what the plans and the rules are.

Put a disclaimer on your mail I thought you represented Tandy management and was my flame thrower ever ready. A quick call to corporate HQ led me to the store where you apparently are a sub-manager or sales driod or something. The attitude you display is the very attitude that keeps a lot

of people out of the Shack.

As to your comments about the scanner it is OK but not that special. My old 2004 has a lot less RF leakage and the Icom R-100 puts it in the toilet in performance. I bought it to work pacsats (packet satellites) with but found a better solution in the Icom-281 so I will sell the thing.

I will do you the favor of not forwarding your post further than to the store manager although Fort Worth was interested in seeing it. Oh by the way I am not in the least embarassed but any of my posts.

3-21-95:Gerald Scmitt writes:

I don't know quite who Jay M. Hoffman is but perhaps he would be interested in the facts. I bought the scanner on plan #15 six months 0 interest. During the six months I also purchased some other things. I made it a point to pay every month enough to cover current purchases and pay on the scanner. Many months the statement said nothing due but I always paid anyway. As I understand the RSVP card agreement if it is paid in full each month no interest accrues. Since I paid the last in first out each month plus covering the scanner I should have owed no interest. Instead I was charged interest on the entire ballance.

I wasn't particularly mad about it. I did find the same thing had happened to a number of hams locally by asking questions on the local nets. My post was intended as a "heads up" to buyers intending to take advantage of the 0 percent interest deals. I performed as per the conditions of the credit promotion Tandy Bank did not.

Upon rereading your letter Mr. Hoffman I am now mad. If you are associated with Radio Shack your response is very poor. Perhaps your new slogan should be: "You question us, we get an attitude."

I would greatly appreciate it if anyone could provide me with the Tandy HQ phone number I think it is time to talk to the folks.

> How do you like the memory configuration (10 banks of 100 memories)?

One example is 863.150. This is a cellular freqency in this area and comes in really strong on the PRO-39 with a rubber duck, but isn't heard *at all* by the 2035. That is, you don't hear anything even with the squelch wide open, and it doesn't stop here when scanning. In other areas of the country this is a business frequency (trunked), at least according to the frequency chart I have.

863.250 *is* a business frequency here and it comes in on both the PRO-39 and the PRO-2035 with about the same strength, using identical antenna configurations.

The advertised bands of the 2035 are 760-824, 849-869, 894-956.

Too bad I don't have a signal generator which will go that high, that would make for a definitive test.

BTW, 100 memories per bank is way too many. It always scans through the empty memories, so for fastest scanning you have to lock out the unprogrammed ones. And while I'm grousing, the tuning knob only works in certain modes, not always when you would like it to.

Hmmm.... the way I read that, anybody can carry a mobile scanner as long as they get a permit from the department of state police (in the state of Michigan).

I traveled back and forth from NY to SFO for almost 2 years every month and carried both my scanner and 2 meter ham radio in my briefcase. I never had a problem or even had a question at any of the security points. You should ask the captains permission before attempting to use the scanner on the plane. He would probably not be a happy camper if it interferes with his navigation equipment. A little courtesy goes a long way sometimes !! Have a safe trip!

any thing with an X refers to a female and 23152 and 23151 are not 10 or 11 codes but actually refer to the sections in the california vehicle code that state what the violation is. It is just eaiser for the cops to say those on the radio then to say a long drawn out word description.

23152 is DUI
23103 is reckless driving, 23103.5 is a guilty plee (plee bargan for DUI)

< yep - more deleted>

>George Warner
>
I don't know about all police radar, but George has certainly hit the
nail on the head with respect to how the Kustom Signals KR-10 works, or
at least the way it is described in the tech manual. Unmodulated carrier,
return frequency mixed with transmitted frequency, the *difference* in
these being filtered, counted, and displayed. Same thing when in the
moving mode ... returned signals bouncing off lots of stuff (cars, trees,
the road itself). The *biggest* returned signal is (usually) from
stationary objects, such as the pavement. The next biggest is assumed
to be the target. These are treated in the same way, with the patrol speed
being calculated from the biggest signal, and the target speed being
calculated from the next-biggest by subtracting out the patrol speed.
This doesn't always work, of course, because passing a really large
truck in the oncoming traffic lane will cause the unit to think that the
patrol car is going the speed of (patrol car's speed + dump truck's speed)
since it will be the largest reflection. For this particular model, and
perhaps all, in moving mode you will not get a particularly meaningful
(IMO) reading for vehicles moving in the same direction. You
go 70, he goes 60, if anything, the unit will show a target
speed of 10. This applies to the model listed above; perhaps something a

little newer with more sophistocated logic can do better. Speeds of less than 9 or 10 are filtered out anyway because the output of the mixer is not significantly different from the source.

Question (because the manual does NOT say) - Is the output signal polarized? Is it circular? Would the return then be circularly polarized in the other direction?

If I'm driving down I-95 with this thing transmitting, assuming it's at the same frequency as Smokey (24.125 GHz), what's it going to show on his unit? Will polarization keep it him from seeing it? Will it act just like a really strong return, giving him a real good picture of my speed?

Corrections/replies welcome.

I have a Pro-2026 scanner and I just bought an Optronics DC-440 Tone decoder
which I would like to interface the two. I need to find a point where I
can connect and get a signal before the low frequencies are filtered out
so that I can decode PL & DPL signals.

Help! Does anyone have a diagram???

Anyone had any experience with the latest rechargeable alkaline craze? I invested a small fortune in the "Millenium" Ni-Cad's which are better than standard Ni-Cad's but are rechargeable alkalines worth the investment?

Also, can you just use normal alkalines? Isn't the technology based upon the charger circuitry and not the battery?

Any suggestions of a particular brand name that you have had good experience with?

Stephen Meier

Hi Simon,

I remember this scanner from a while back, If I remember correctly
they were quite limited on the frequency coverage, and the mode
was fixed on each band. Reception was quite good, but the
limits on the frequncey were the downside.

All the best Paul.

p.s. Check out alt.radio.scanner.uk someone there might know ?

Don't throw out your nicads just yet. I bought the rechargeable alkalines after they first came out, along with the charger. I have recently switched back to nicads, and junked the alkalines. I found that after 6-10 recharge cycles the alkalines held almost no charge, and were useless.

Radio Shack Pro-43 in mint condition with box, manual, nicads and charger. Cellular has also been restored.

I'm looking for a quality shortwave receiver such as a Kenwood R-1000 or R-2000 or equivelant.

Marc - Thousand Oaks, Ca

Last I heard the display is in base 8 OCTAL so any calculator that will convert
from octal to decimal (base 10) will work.

Rechargeable alkalines are based on a different technology that results in a rechargeable, though somewhat reduced capacity, alkaline cell. I will only use rechargeable alkalines since I have had excellent results with them. The amount of charge left in them during use is more predictable than nicads.

They don't have a memory effect that nicads do, therefore I often 'top off' the batteries before extended use. This type of recharging can lead to a much higher than the 25 recharge cycles Rayovac claims. One thing I did notice, the documentation states AA's get recharged in 3-5 hours, but I noticed the capacity seems much larger if you recharge for 12-18 hours. They cannot be overhcarged since the pulse charger stops at 1.65 volts, but it will maintain the charge at 1.65 v. I don't recommend leaving it on charge but the people I know who claim no adverse effects and you always have a 'topped off' set ready to go.

Try them, you'll be pleasantly surprised.

Andy

I wouldnt touch an R1 with a Pro43. I had one and it's really junk. Small speaker, terrible intermod. The only thing interesting about it is its cuteness. Otherwise forget it. Programming is a oain and not worth it anyway. The previous of course is IMHO.

I maintain the callsign list for Steve Douglass who publishes the
Intercepts Newsletter. The list is about 2400 callsigns long. I
would send it to you, but it is the property of Steve.

If you are interested in buying the callsign issue or subscribing
to the newsletter, here is all the dope:

Steve Douglass
Intercepts
PO Box 7176
Amarillo, TX 79114-7176

The newsletter is very good and well worth the subscription price.
It is 6 pages long (both sides of 3 sheets) on 8 1/2 x 14 paper. The
price is $18 per year if you get it in before April 1st. After that
the price is going up to $20. Back issues are usually $3.00 each
(include a SASE - a legal sized one). I'm not sure what Steve will
charge for the callsign issue because it is twice as big as the
regular ones. You can contact Steve and ask him about it if you are
interested. His email address is: STEVE1957@AOL.COM.
Sometimes he is pretty slow at responding to email. He also writes
for Popular Science and is very busy. If you contact him, tell him I
sent you. (Prices will vary for international mailings.)

Before I get flamed, I am an unpaid, volunteer member of the
Intercepts staff. I have absolutely no interest in rather you
subscribe or not. If anyone has any questions about particular

callsigns or bases, I will try to answer.

Also, if you can give me any info about any callsigns, aircraft, and the base they are assigned to, I would really appreciate it. The callsign list we have is from scanner listener's input We do not ask for anything that is classified or sensitive. What we are after is the routine callsigns assignged to aircraft at their home bases. For example: CORVETTE F-16 388th FW, Hill AFB, Utah

Regards,

-Gary

RADAR MILE is 12.36us or the "round trip" and is ONLY used for pulse
transmissions. so much for 20 plus years of military pulse radar work.
Police radar uses doppler shift and Police Laser guns use "PULSED"
IR, thats how they can also use it during accident investigations to
measure "distance" at the accident scene, can't do that with a police
radar gun.....ya'all have a good one.........

3780. Results of AM on scanner.

Newsgroup: rec.radio.scanner
Date: 1995-03-22 18:14:00 UTC
From: gregjo@wordperfect.com
Message-ID: <gregjo-2203951114000001@pcgjohnson.orem.novell.com>
Source record: 259597

I previously asked how to be able to pickup standard AM broadcasts on my scanner. Many people responded--thank you one and all!
Some people responded: Most scanners don't cover those freqs. (Mine does: AOR1000XLT)
Others responded: Why would you want to do this? (Answer: Just to see if it CAN be done. I do have a car stereo that picks up AM, ya know?)
And now to the results:
Many suggested a VERY long antenna. I haven't got around to trying a 400 foot antenna yet. Maybe later...
Others suggested using a wire-wrapped ferrite bar antenna. I finally went to a thrift store and bought a transistor radio. ($1.99---Oh, what a deal!) I broke it open and stole the ferrite bar, stripped one wire end and shoved it into the hole in the BNC on top of my scanner. Did it work? Yes and No. I tuned to what I consider the strongest local AM station. Without any special antenna, all I get is static. With the ferrite bar antenna attached, I can hear faint sounds. So it did improve the reception! But not enough to make out any of the sounds. I guess it's the old sensitivity problem many people warned me about.
Anyway, I enjoyed this episode!

1) Monitoring the Military

2) Northeast Directory of Military Aviation Communications (other regions available also)

Both the above are available from Grove Enterprises. I highly recommend the above, especially #2, which list HF freqs also. Listed by state and there is a freq index for looking up the possible origin of comms when searching freqs. The callsign info was in #1 above.

What you didn't take from the radio is the variable capacitor tuner which
is part of a resonant tank circuit with the ferrite antenna. The tuning
cap resonates the antenna for the frequency and makes a tremondous difference
to the amount of signal that is delivered to the scanner. You need to
replicate the entire ferrite/tuner section, a bit bulky for the AOR 1000.
A 10 - 20 foot wire may do better, and ground the scanner case to something
in the house.

3786. Rechargable alkalines Better?

Newsgroup: rec.radio.scanner
Date: 1995-03-22 19:43:59 UTC
From: smeier@uspto.gov
Message-ID: <3kpulv$nte@pioneer.uspto.gov>
Source record: 259603

Are the rechargeable alkalines worth the investment? I've already spent a small fortune for an arsenal of the "Millenium" Ni-Cad's. I feel they are OK, but for things like flashlights that sit around for 6 months, you still can't beat ordinary alkalines.

Is there any difference between an ordinary alkaline and a rechargeable one. I think the technology lies in the charger not the battery, but I'm not sure.

Any brand name suggestions?

3787. Digital information preceeding police transmissions???

Newsgroup: rec.radio.scanner
Date: 1995-03-22 19:55:02 UTC
From: mudaw@uxa.ecn.bgu.edu
Message-ID: <3kpvam$2q5@ecom2.ecn.bgu.edu>
Source record: 259604

The county police where I live have some sort of digital
information which is transmitted from their car's radio every time
they transmit. Is anyone familiar with this? What information is
contained in this signal? (I assume it informs the base station
which car is calling, and logged into the computer automatically)
Also, what kind of signal is it? It isn't digital like what I am
familiar with. It doesn't sound like Amateur Packet Radio, which
sounds like what digital information from you PC sounds like. It
sounds more like a series of evenly spaced tones, but all of the
same frequency. So it isn't just a very quick DTMF.
What is it?

Thanks,
Dave

3788. DTMF 'F' ?????

Newsgroup: rec.radio.scanner

>Is there any one online that has installed the optoscan unit into a
>pro2006?

Yeah! I'm one of them.

>If so how easy was it?

With extreme caution, it took me four hours and work OK first time.
Circuit board is professionally made and existing cables goes from 2006 to
the board and supplied cables goes from board to 2006. No drilling or
soldering required, but I did unsolder the backup battery clip to make my
life easier, as suppose to bust up the plastic container with the tip of
a screw driver. I did have to trim the back plate a little, 1/16" so that
the clam shall case closed up neatly.

>how good does it work?

When the program is NOT running on PC, 2006 act as nothing ever happened
to it. You still have your 400 channels to program in by hand.

When the program is running the Opto board took over the CPU and your PC
do the talking. Board is also capable of decoding DTMF/CTCSS/DCS which
factory 2006 cannot do. Scanstar software in particular also have
spectrum analyzer which is pretty neat. It can scan as many channels or
banks as you can put them on file. NOTE: This board DOESNOT program the
factory 2006 memories, It simply takes over.

3792. Scanner reception problems with the PRO-62

Newsgroup: rec.radio.scanner
Date: 1995-03-22 20:45:19 UTC
From: icrcb@asuvm.inre.asu.edu
Message-ID: <3kpuj6$ibd@news.asu.edu>
Source record: 259610

I recently attended an airshow with my PRO-62. While trying to find the correct frequency, I noticed a man listening to the action. He gave me the correct frequency for the event. Standing right next to him, I could hear the action on his scanner, but mine did not pick it up. Is it possible to cancel out another scanner by being in proximity? On leaving the event, the signal became clear(too late tho). Or does my scanner have a problem?

Also, I find it hard to believe that someone is not working on mods for the PRO-62. If there is, may I inquire to any success with the mods?

Thanks

I think the new Lithium AA batteries may change that. I priced them at
Home Depot for $3.90. At our local Albertsons food store, they are $5.88!
So far, they seem to be holding up well under lots of use. The voltage is
1.7 new so you get around 10 volts out of a 6 pack!

Careful ! AEA FAXIII is basically for decoding WEFAX from shortwave signals and
may not work too well on the NOAA sats. My understanding is that the signals
are in a different format and I am open to education on this! I should shortly
be testing some new low-cost decoding software specifically for satellites and

I'll post to the group when it is up and running if there is any further interest.

They last longer than nicads but less than regular alkalines.

They don't self discharge while unused the way nicads do.

They're the ONLY solution if you want rechargeable AAA's since AAA nicads
have no useable capacity.

>Also, can you just use normal alkalines? Isn't the technology based upon
>the charger circuitry and not the battery?

No. There are design changes in the electrolyte, seals, and internal
construction to allow partial recharging without explosion or leakage.

Finally received my Grove catalog and have a question regarding a cost and performance choice.

I can order a PRO-2006 ($370) and the OPTOSCAN 456 ($280) for a total cost of $650.

Or, I can order the PRO-2035 ($400), the GRE Converter ($85), and the OPTOSCAN 525 ($90) for a total cost of $575. I'm ASSuming the OPTOSCAN 525 provides the same capability as the 456.

Isn't the 2035 combo a better deal? Any info would be appreciated...

> >Has anyone heard of this and if so, what airlines permit this?

It depends a lot on the individual airline. Some permit it and some don't.
It is a good idea to check the in-flight mag to see what the rules are before
turning it on. (in my case, the important page got "stuck" to another page,
so I missed the prohibition. The flight attendant told me to turn it off,
which I did. I later found the regulation after peeling apart the pages...)
United explicitly says that no receivers can be operated at any time during
flight.
When unsure, check with the flight attendants. Some people even ask the pilot
or captain if things aren't too busy. When I'm in doubt, I just turn it off
to avoid raising blood pressures....

3801. RE: HOW POLICE RADAR WORK

Newsgroup: rec.radio.scanner

Fred N. Zuschlag (ZUSCHLAG@LMSC.LOCKHEED.COM) writes:
>I don't know about all police radar, but George has certainly hit the
>nail on the head with respect to how the Kustom Signals KR-10 works...

Virtually all police radar works the exact same way. It is a tried
and true and, most importantly, very inexpensive technique.

>Question (because the manual does NOT say) - Is the output signal
polarized?
>Is it circular? Would the return then be circularly polarized in the
other
>direction?

It is usually vertically polarized.

>If I'm driving down I-95 with this thing transmitting, assuming it's at
>the same frequency as Smokey (24.125 GHz), what's it going to show on his
>unit? Will polarization keep it him from seeing it? Will it act just
like
>a really strong return, giving him a real good picture of my speed?

Correct me if I am wrong but I am interpreting this question as "What
will happen if I transmit a signal at a cop who is using radar on me at
the exact same frequency?

Theoretically, several things *could* happen. Practically (i.e.
statistically)
speaking, nothing will happen.
Here are the possible scenarios:
Case 1 (the most likely): Frequency sources have some error. At
microwave
frequencies (X - 10.525 GHz, K - 24.125 GHz), that small error (small
percentage of error) is actually quite a bit in Hz. Just a 0.001% error
at
K band is 241,000 Hz. In contrast, your Doppler-shifted reflection
differs
from the radar transmitter frequency by about 70 Hz for every MPH. At
60 MPH this would be about 4200 Hz. Even if you somehow had an exact
source, the police radar would probably not be exact. Above and beyond
that, police radars aren't extremely stable because they are so cheap
(note, however, that this instability contributes almost no error because
of how these units work -- sorry, but this is not a valid argument in
court).
What will happen is that your signal will be received by the radar unit
and mixed down to the difference frequency (241,000 Hz in this example)
and rejected by the low-pass filter in the radar signal processing

circuitry. Radar units use a low-pass filter to eliminate unwanted signals. This example frequency corresponds to the Doppler shift of a vehicle traveling at over 3400 MPH (definitely an unwanted signal).

Case 2 (possible but not probable): Your transmitter emits a frequency within the small bandwidth of the radar receiver. The radar will interpret the signal as a reflected Doppler-shifted signal and give an inaccurate reading.

Case 3 (purely theoretical): Your transmitter emits a frequency exactly the same as the radar transmitter. Because you are moving, there will still be a Doppler shift; but it will only be half of the normal Doppler shift because the path of your signal is decreasing by half of the rate of the path of the normal radar signal which must go out and back. The radar unit will display a speed which is half of your actual speed.

These cases, as I have written them, suggest that it is very difficult to jam or fool police radar but that is not true. There are other techniques to jam police radar but that's a story for another post.

FOR SALE: 2 Motorola HT-90 handhelds
UHF, 4 watt, 476.xxx mhz, with 4 new nicad (rapid chg)

The radios are only set up for one channel, but will accept crystals for the second channel (for repeater, etc). A charger and holster is included. The radios were checked and calibrated to factory specs by a authorized Motorola tech. I put these radios together for my father to use while hunting but alas, he gave hunting up. I have invested over $400 in this venture, but I know you don't get that back when selling them.

Asking $300 or best reasonable offer.

>owners. (My Yupiteru 7100 did NOT suffer from this defect.)

This is a common complaint. I have the same complaint with my AR8000, and the same thing happens with my Yupi7100. I can't fix the "problem" for you (or for me), but (at least) I can explain what it is.

The radio is receiving an FM signal who's deviation is wider than the bandwidth of the IF filter being used. When an FM signal is wider than the IF bandwidth, (i.e., outside what the IF filter passes on), the squelch closes. If the signal is a voice, the squelch chops in and out with the peaks of the voice. The setting of the squelch control has NO effect on this (except that if you set the squelch right on the hairy edge, it will minimize the effect somewhat). Note that your signal strength meter is NOT reading this signal, and is unaffected (the signal strength meter usually reads the amount of AGC applied).

This problem only happens rarely _except_ for the cellular band... The narrow band FM IF filter in both the AR8000 and the Yupi7100 is designed to deal with the normal bandwidth broadcast on all the other narrow band FM services (e.g., Police, Fire, Ham, Weather, etc). Note that most services are on 25K spaced channels. Note that cellular channels are spaced at 30K. This is because cell phones use a _little_ more bandwith.

It pisses me off too.

I have a Bearcat 590xlt with a PL decoder. I find that on weaker signals the PL drops out. If you turn off the PL board, the signal is very readable.

Does anyone know if there are sensitivity adjustments for the PL? or has anyone experienced this problem.

Chris <seguine@sirius.com> wrote:
>The m-400 is a little more $$ and a little bigger so I'm trying to find
>out if any of those other protocols are worthwhile.

I think the M-400 is worth the money. Decoding pages can be fascinating. Patterns can be studied in telephone numbers and their attached digits. Alpha-numeric messages of many kinds can come through in bursts and can be read off the air. If sent to a printer, the M-400 can push out a hundred pages of pages in a handful of minutes.

Each pager has an identifying number that comes with the page directed to it. If I sent a test page to my friend's pager, and waited on the frequency assigned to his pager (embossed on the pager), I could note his id code when the page came through to him. For the rest of the evening, I could see the pages that he received. If I had my M-400 tied to my computer and dumped directly to my hard drive (which takes a parallel-to-serial converter--approximately $80), I could do a search and cut after a period of time, and tell him all of his pages for the week, say. With a CD-ROM phonebook and a CD-ROM street map, I could identify a fair number of those pages, and locate where they came from. I could e-mail him when a page came through for him, and send the content of the page.

It is amazing how much data can pour through the M-400, in many different modes. Even without a computer, the buffer is pretty large, and it is easy to scroll back through what has been decoded. RTTY (radio teletype) comes through well (using my Sony 2010).

My only qualm is that the M-400 throws off a good bit of radio frequency interference (RFI), which doesn't matter in the high frequencies, but which hurts in the low ones, unless you use a shielded antenna cable coming in, as I do. That makes it tough in the car for 46 Mhz range, because the radio frequency interference is so strong that it overwhelms the scanner. But if I recorded stuff in the car, I could decode what I brought back to it, even pager stuff. The M-400 runs off the voltage that comes from the cigarette lighter, using approximately the same plug as one would use for the Pro-2006.

For me, the scanning hobby is not complete without at least the equivalent of the M-400. When even 2-meter hams are sleeping and police calls and 800 Mhz communications are far and few between, the pages continue (with hundred-mile ranges) into the night, so many seemingly illicit, so many that would cause one to blush were one not hardened by Hard Copy and the occasional daytime talk show.

Several states and localities have clauses in their mobile scanning laws that refer to obtaining a permit from some authority.

How likely is it that Joe Citizen can actually obtain one of these permits?

I've seen a frequency finder software for Pennsylvania, I wonder
if anybody knows if there is such a thing for New York state.
The software includes finding a frequency by city, by county,
browse all frequencies and lookup by frequency. It sure would
be nice to be able to use this! Any help would be much appreciated

I was once challenged at Vancouver International when I had a Pro43
in my carryon luggage. The xray tech asked if I had a "radio" in my
luggage. I foolishly answered "yes", instead of correcting him by
clarifying that it was a "radio receiver". His next question was,
did I have a license for it (meaning a transmitter), which I didn't,
because it wasn't. In the end, his supervisor realized it was
a receiver and let me pass on to my departure gate.

They never asked me to turn it on.

Well, whether or not a state can have a more restrictive law is sort of the
$68,000.00 question. In regards to scanners, the FCC says no they can't,
atleast not where hams and ham radio transceivers are concerned. However, to
my knowledge, and I try to follow this topic pretty closely, the FCC order has
yet to be tested in court.

In my own personal opinion, I would look at it this way. If you are a Novice
and you want to put a 2 meter radio in your car (even though your license class
wouldn't allow you to transmit on it), then I think the FCC order would protect
you. If, on the other hand, you are a Novice and you want to put your favorite
Uniden scanner in your car, I have a feeling the Michigan law would prevail,
and you'd have some legal problems on your butt.

The only time I've heard anything on white 2 or 3 is during major brush fires. This is when you have units from hundreds of miles away and the easist way to have communications is on common frequencies. Thanks to whoever posted those other two freqs!

Many business use 154.600. Including McDonald's Drive Thru. They also use a CTCSS tone of 107.2 and I believe this to be the standard across America. So if you have say, a 2 meter amatuer radio which is modified to transmit on this frequency...never mind.

What is the likely effect of wiring a Pro39 up to a large outdoor discone or similar?

Various books suggest that this could cause intermod/overloading problems due to poor front-end filtering on handhelds.

This is in the context of a fairly rural area, but with a medium-sized town a few miles away.

3819. ILS/VOR

Newsgroup: rec.radio.scanner
Date: 1995-03-23 11:22:11 UTC
From: wa5iyx@n8naa.sat.tx.us
Message-ID: <oRye3c2w165w@n8naa.sat.tx.us>
Source record: 259688

I wonder which brand(s)/model(s) of scanner might be best for getting the ILS/VOR navaids (108-118 MHz)? Several tuneable units that I have tried suffer from overload/intermod by the local FM stations or produce only very poor audio with those lightly-modulated AM signals.

I would like to use this in conjunction with VHF propagation studies (Es). My trying to use the "overspill" on an FM tuner has netted but a few loggings and LOTS of frustration during the skip openings.

Almost 3 years ago I thought that I had a good offer on some genuine commercial (tube-type) pulls from airline craft but that never came thru. (They would have certainly been resistant to FM overload!)

: What is this?

: Thanks,
: Dave

The DTMF keypad really has 16 keys, normally referred to
as 0-9,*,# and A-D. Perhaps the decoder you're using thinks of
the pad as more binary, or A-F. The 'F' must refer to the key
from the lower left or right corner of the full pad. I've seen
decoders that simply return the binary combination codes and
don't special-case out the '#' and '*'.

To be certain, check the manual, or experiment by tuning into
one of your own cordless phones and trying out keys. SInce your
phone only has 12 of the 16 keys, if you can't generate an 'F'
from your phone, you've found some computer generated DTMF.

3821. Novice needs info

Newsgroup: rec.radio.scanner
Date: 1995-03-23 13:28:50 UTC
From: d89marho@und.ida.liu.se
Message-ID: <D89MARHO.95Mar23142844@kol7.und.ida.liu.se>
Source record: 259691

I'm thinking about purchasing a scanner. I'm chiefly interested in WeFAX, RTTY, CW and such stuff, but if I can get a (portable) unit which will take in shortwave broadcasting (1.6 MHz - 30 MHz) and broadcast FM (87.5 MHz - 108 MHz) I'd be happy. Obvisouly I don't expect stereo FM.

I don't need cellular capability (as far as I know, this is illegal in parts of the world anyway). Besides, I live in Sweden, and I don't know what the cellular frequencies are here (most people seem to use GSM, a digital system anyway, so a scanner wouldn't help).

I'd like a small(ish) portable thing. Something the size of a larger cellular phone perhaps. Earphones or earbuds is a must, built in speaker would be handy.

Trouble is, I don't know what exists. I've read an issue of Popular Communications, but I can't really compare scanners, since I don't know much about them. There's something called an AR1000XLT which covers 500 kHz to 1300 MHz (minus 800 MHz - 899 MHz) which seems interesting.

Also what would I hear with this? What exists above the broadcast FM band? 1300 MHz seems awfully high to someone used to punting around the SW broadcast band... Would I be able to pick up satellite communications with this? Basically, what's out there, guys?

Although this is not the normal way you would see cell frequencies listed, my
guess is that the range for "Cell" is referring to the cell control
frequencies (non-voice).

Warning, don't ever try recharging Lithium. Rechargeable lithiums are on hold
due to a devastating test run in Canada a few years ago involving a
rechargeable lithium cell phone (Boom!). It blew up in a users face.
I'm told that we won't see any rechargeable lithium until after the year 2000.

You will probably need to get a new keypad. If I recall correctly, it isn't
that hard to replace if you are comfortable taking apart the scanner. Since
only one key is bad and the keypad is setup in a matrix, it is probably just
some crud that has built up between the key and the contact point on the
PC board. Usually the keypad is very hard to get inside, but if you could,
you could try spraying some contact cleaner (like TV tuner cleaner) inside to
clean the contacts.

m> sounds more like a series of evenly spaced tones, but all of the
m> same frequency. So it isn't just a very quick DTMF.
m> What is it?

This is Automatic Number Identification (ANI) it comes in several formats:

DTMF
5/6 Tone with about 6-10 variants
Digital - GE Star, Motorola, & Midan Zap

If it sounds like a quick "bzzt" then it is most likely one of the digital
formats. If it sounds more like someone who is dialing a phone VERY QUICKLY
then it is one of the analog tone formats above.

Information included:

Unit Number
Status - In Service/Out Service, Emergency
Man Down
Lat/Long. from GPS for AVL

There are a whole host of items which can be done with these ANI systems. Some
allow for radios to be disable ("stunned"), check to see if their on, activate
tx with out indication etc..

One thing that I forgot to mention earlier. If I remember correctly the M400 does not decode DTMF while the DC440 does. This may make a big difference in your decision. DTMF is used for autopatches, cordless phones, cellular phones, etc.

>The tone corresponding to the F was singular. ie One tone produced the F.
>What is this?

I don't have a reference chart handy but there are 16 DTMF tones. The
standard 0-9, #, and *, plus A,B,C,D,F

Since A-F are not on a telephone they tend not to be used very often. Most
Ham rigs that transmit DTMF cover A-F.

I didn't realize that the 51R would decode DTMF. Is that correct?

Here in Georgia, 154.2800 is the mutual aid frequency. When I visited
Ohio, I noticed that the most departments use the same low-band frequency.

How about the 866-868 Police Mutual Aid - has anyone heard activity on these?

>interest.

Yes. The HF weather FAX information is frequency modulated (FM); i.e. the frequency of the audio tone of the transmission reflects the degree of darkness of that pixel of the image. The APT (Automatic Picture Transmission) off of the NOAA/GOES/Meteor satellites is amplitude modulated (AM), where the amplitude (loudness) of the constant-frequency transmitted tone dictates the black level of the transmitted pixel.

There's a potential for confusion, because the term "WEFAX" is used for two types of transmissions. HF WEFAX is the FM method of image transmission. GOES-WEFAX uses the AM method, and downlinks in the 1691 MHz frequency range from the satellite.

I've used the AEAFAX interface on HF, and have played with a Dahl board for APT and GOES-WEFAX. Very different methods of demodulating. The AEAFAX interface is nothing more than a audio voltage zero-crossing sensor which hooks into your serial port. The software then determines the audio frequency of the HF WEFAX signal by timing the interval between the zero-crossings. This circuit has no amplitude-measurement capabilities to my knowledge. Since the frequency of the carrier tone for APT does not vary, the AEAFAX interface will NOT work with APT.

Steve: I don't know what the Hamcomm interface is, but if it's the zero-crossing detector I've described, it is incompatible with the AM APT downlink. I have the parts for the JVFAX interface which uses the A/D converter schematic included with JVFAX. But like many other projects, I haven't had time to build it...

>Isn't the 2035 combo a better deal? Any info would be appreciated...

If you are going to use the computer control a lot, then the extra memory of
the 2035 is useless (since the 456 or 525 does not read or program memory).
So the decision comes down to which one has the better RF section. That
award would go to the 2006.

*>that area I would appreciate them.

Here is a list that I tend to find kindo' useful.

-----------------------------------8<---------------------------------

Denver/Eastern Front Range/North Central CO Expanded Edition 9502

SCANlist 9502 Volume 7 #9 COPYRIGHT 1995 Phil Mangone. All rights
reserved. Updated 2/05/95 for Denver and the Eastern Colorado Front Range.

Distribution of this list is at no charge and courtesy of this BBS
from the The Metro Comm Center. Use of this on-line publication for monetary
gain or republication for profit without permission of the Author in part or
whole is prohibited.

Updates to this list and other frequency lists are available for download
from The Enterprise BBS @ (303)659-8294 for the Denver Metro area and
(303)785-0217 for the Greely/Longmont/Ft. Lupton area, The King's Market
BBS @ (303)665-6091 for the Denver Metro area and Longmont, (303)225-3491 in
the Fort Collins/Loveland/Wellington area and (303)346-3491 in the Greeley
Area. Please send all e-mail correspondence to me through either of the
above listed BBS systems or the Colorado Scanner Echo Available through
the above listed systems.

Use of this information in the commission of a crime is prohibited
and prosecutable by Local, State & Federal Laws. I do not assume
responsibility for misuse of this information.

Due to the nature of Public Safety Communications frequencies and use
are constantly changing therefore I do not assume responsibility for
changes, incorrect information and omissions. Use of this list is to
enhance one's use of a scanner or similar type receiver.

At the time of release of this file there are no known mobile scanning
laws within the state of Colorado. However due to 'home rule' jurisdiction
allowed by the state it would be wise to check on local regulation in your
area.

I do not encourage anyone to "Chase" calls as you are asking for trouble
with law enforcement officials and they will not hesitate to prosecute.

KEY INDEXES AND DEFINITIONS

F-# Short for channel . i.e. F-1 is the same as channel 1.
###.##### S Indicates non-repeater use. Both base and mobile stations
use the same Frequency Commonly referred to as "Simplex"
PD Police Department
FD Fire Department
FPD Fire Protection District
LG Local Government. i.e. Public Works, Animal Controletc...
R-# Repeater Frequency sequence for trunked G.E. systems
M-# Mobile transmit frequencies for trunked G.E. systems
for "Input Scanning"
IFB Interruptable Feed/Fold Back. TV audio feed for reporters.

NOTES FOR FEBRUARY:

GREENWOOD VILLAGE

All Police comm is on the Arapahoe County 800 MHz system however public
works opearations are still on 453.650.

AURORA

On Monday February 6th all of the old PD/FD repeaters were taken off
the air and retired. So far there's been no word any applications for
those frequencies by other agencies.

LAKEWOOD 800

Still nothing on which system they are in favor of at this time though
it is definate they will be operating on 800 MHz in the future.

STATE 800

The G.E. EDACS 800 System listed under the State of Colorado section is
very active with comm involving an Ambo-cab type operation which one it
is we are still working to identify. The system is operating in
"fail-soft" or the "old mode" which all comm originates on one frequency
in the trunking pattern until a second group begins using the system and
is routed to the next repeater in the sequence. Unfortunately the "G.E.
Jingle" is turned on.

COMPUSERVE

This edition is being sent to the Compuserve HamNet file area for
nationwide distribution. If the response is favorable future editions
will be sent to Compuserve.

How silly of me. 'F' would make 17! I guess I was just thinking about Hex characters: 0-F. Maybe your radio displays * or # as 'F' ??

3834. Any way to listen to digital Motorola Sabers?

Newsgroup: rec.radio.scanner
Date: 1995-03-23 15:52:46 UTC
From: wired@genes.pl.my
Message-ID: <795973966.71snx@genes.pl.my>
Source record: 259696

The local police use digital Motorola Saber Systems transceivers. All I get is static, with the occasional end-of-tx bleep. Any easy way to convert this back to analog?

3835. Re: Rechargable alkalines Better?

Newsgroup: rec.radio.scanner
Date: 1995-03-23 16:52:55 UTC
From: dgoodman@aol.com
Message-ID: <3ks917$7e5@newsbf02.news.aol.com>
Source record: 259697

>Are the rechargeable alkalines worth the investment?

While you don't get nearly the number of recharge cycles from alkalines as nicads, I've found them much easier to manage among my array of portable toys. I've switched entirely from nicads to the Rayovac Renewal batteries, which require the Rayovac recharger (I use the smaller, AA/AAA charger). They exhibit essentially the same shelf-life as alkalines, and you don't have to run them down prior to recharging (in fact, you get more life out of them if you swap 'em before they run down). For the first dozen or so cycles, I also get much longer life from a set than from a well-trained set of nicads.

Therefore, if I'm not sure whether a set of batteries will last the time I need them (e.g., taking a scanner to a ballgame), I'll put in a freshly charged set. I use them for my scanner, portable CD player, Newton MessagePad 120, and low-power 2 meter handy-talky. They're not good for high-current drain applications, such as higher-power transmitters.

Danny Goodman

3836. Re: GPS receivers

Newsgroup: rec.radio.scanner
Date: 1995-03-23 17:02:14 UTC
From: ron@fc.hp.com
Message-ID: <3ks9im$t3i@tadpole.fc.hp.com>
Source record: 259698

kk4l@vnet.ibm.com wrote:

: I have an ICOM GP-22. It lied to me in the Colorado high country and
: it took us (my 25 yr. old son and I) 3 days to find the truck.

Discussion in rec.backcountry tends to converge on the opinion that
one should never be without map & compass skills in the backcountry.
But it might have been a foggy 3 days.... I dunno.
Or maybe the unit just has a lousy human interface and couldn't tell
you that it wasn't trustworthy yet.

: I have talked to Icom service and they claim that I should have
: done an "almanac" in the location that I was using the receiver.
: According to the instructions, accuracy is not why one does an
: almanac. There is an outfit in Kansas whose name I've forgotten
: but it's something like Cerwin, who has been working with the
: FAA on putting GPS into aircraft. They have what LOOKS like a
: much better receiver. Their product is advertised in the latest

Garmin probably. One of several companies selling a selection of
2nd and 3rd generation GPS receivers.

: Cabellas catalog. They use an 8 channel receiver and there is a
: display mode that shows signal strengths. I think my problem
: was due to multi-path distortion, but I can't prove it. I tested
: the receiver in another location (still in the mountains) and when
: I moved 50 feet, it told me that I had moved 8 miles.

Without signal strength indication and 'state of tracking' it's hard to
know what quality fix you're getting.
Most 2nd and 3rd generation units provide this very well.

: I'm going to forget that I paid $750 for the ICOM and go buy one
: of the new ones ($499 I think) before I stray too far from a
: marked trail, or stream bed, again.
: Ken D. - KK4L

I've recently bought a Garmin GPS40. Very compact, good battery life, good
human interface. It still doesn't work very well under trees on the side
of a ridge due to occlusion of the satellites. I have found my track
velocity to be as high as 2mph when standing still even when the unit
indicates it has a fix. But I'd be stunned if it showed me a variation of
8 miles! (and I was using it in the Colo. high country too with plans to
do even more above timberline)

The Cabela's catalog is a great place to get a feel for the variety of
GPS units that are out there for hunters/fishermen.

The small-boating industry has their additional selection of salt-water Nav GPS too.

GPS is somewhat off-topic of rec.radio.scanner but I wouldn't be surprised if MDTs and dispatchers start getting some kind of GPS interface to units. Imagine how search-and-rescue would change if a person just whipped out the old cellphone, pressed 911G and the phone/GPS unit sent the location of the emergency!

The Military does have the technology to keep their comms secure, therefore
if they are not using the technology they will have to accept that people
will be monitoring. If the broadcasts are not encrypted I can only assume
that the comms are not secret.

I have heard Northern Lights and Bandsaw as well, many times from Ottawa.
The callsign I heard that I haven't figured out is Milchafe 9 I heard
him contact Griffiss AFB about a year ago. Was a heavy of some sort, because
of the amount of fuel he wanted, needed ground transport for 23 persons, and
Class B security for the bird... My best guess was either a RC-135 or maybe
a JStar.

Interesting. You do not need a license to have a transmitter in your
posession, only to transmit on it (please, do not correct me about
transmitters that don't need a license. Thank you, all). Also, even if you
did, it would not be in his jurisdiction to question you about it.
Looks like another case of a little person trying to make a little authority
go a long way.

The '39 is dual conversion, and you are hearing an image there.

KS> 863.250 *is* a business frequency here and it comes in on both the
KS> PRO-39 and the PRO-2035 with about the same strength, using identical
KS> antenna configurations.

Yes, that's a legitimate freq, and both scanners will hear it.

KS> The advertised bands of the 2035 are 760-824, 849-869, 894-956.

Thanks.
KS> BTW, 100 memories per bank is way too many. It always scans through the
KS> empty memories, so for fastest scanning you have to lock out the
KS> unprogrammed ones. And while I'm grousing, the tuning knob only works
KS> in certain modes, not always when you would like it to.

Hmm... If you really don't like it, I'll give you $200 for it :-).
Thanks for the response.

A> determines the difference between the two speeds to get the speed
A> of the target.

That won't work. Unless the stationary source is either dead ahead or
astern, then the speed of the transmitting vehicle can't be determined with
any real accuracy, unless the radar unit has a way of inputing the angle
of the stationary object "off the bow", and they don't.
The way I described movimng radar was gotten from the Santa Rosa Police (Ca)
about 15 years ago. This was the only way to get an accurate speed of the
transmitting vehicle then, and I don't think the technology has changed
enough for the radar unit to automatically determine the angle (while it
IS possible, and more sophisticated radar units do this all the time,
space and $ prohibit it's use for traffic law enforcement).
Interesting.

"COMMUNICATIONS QUARTERLY" Reports a Milestone in Communications Receiver Development!

The upcoming Spring 1995 issue of "COMMUNICATIONS QUARTERLY" will feature an article titled: "The Watkins-Johnson HF-1000A Milestone in Communications Receiver Development." This informative piece is written by Scott D. Prather, KB9Y, an author who is frequently published in the Quarterly.

Those of you who would like to learn about this new receiver will find a plethora of information that will explain in detail what it is and how it works. Mr. Prather begins his article: "The Watkins-Johnson HF-1000 is the first affordable, stand-alone commercial receiver to use digital signal processing (DSP) at the IF level. In the HF-1000, DSP provides IF selectivity, demodulation, noise blanking, fine tuning, passband tuning, and signal strength calculation, along with several other features ... The use of DSP in the HF-1000 represents a major turning point in receiver technology." One key piece of information offered by Mr. Prather is that the unit is relatively simple to use. He explains: "I found I could execute about 90 percent of the receiver's features without referencing the manual." In conclusion, the author continues: "So, what's it like to use a digital receiver? It's unbelievable! ... the HF-1000 [is] the most enjoyable receiver I've ever operated." "Watkins-Johnson has made a brilliant move into the future of communications receivers."

The article features such topics as: an overview of the HF-1000, the HF-1000 RF assembly, a brief tutorial on Digital Signal Processing, the HF-1000 digital control assembly, and using the HF-1000. Other features include a schematic of the Siliconix Si8901 high-intercept mixer and photographs of the RF and digital assemblies within the HF-1000.

If you'd like to know more, pick up your copy of "Communications Quarterly" -- on newsstands in May.

The "security person" , none of them are xray techs

> luggage. I foolishly answered "yes", instead of correcting him by
> clarifying that it was a "radio receiver". His next question was,

It really doesn't matter what you reply, whether it's a radio or a radio receiver, it is still a piece of electronic gear, that is the important fact.

> did I have a license for it (meaning a transmitter), which I didn't,

It is not the person's job to confirm anything about licensing, you may have got a "keener" or one who is on a power trip because he puts on a uniform and has a little authority.

> They never asked me to turn it on.

They had every right to do so, to confirm that it was a working receiver

Unless you must have your radio etc on board with you, it is usually best to put the items in your checked baggage (I'm referring to North American flights). There is usually no hassle. I know, bags get lost and damaged !

A good rule when you encounter problems at the security checkpoint is to call the supervisor. There really is nothing gained by arguing with the person at the check point. If it holds up the line, so be it.

A final thing to remember is that the rules, people and check points are there so that all of us get safely to where we're going.

Sometimes the contrary, during the pending Haitian invasion when Carter was
trying his last ditch attempt at a peaceful resolution, the HF and UHF freqs
were buzzing with tactical comms in the CLEAR, this showed the Haitian
military the U.S. was serious and about to dump hell on them if they
didn't go along.

Encryption is costly, and unless classified strategic info is dispatched,
most comms will be in the clear. There's quite a bit of logistics involved
in using an encryuption system, and needs to be justified for all branches
involved to use.

There are coded terms used for comms in the clear, and that apparently
is good enough for daily ops.

What if it was a CB? No licence required in Canada as far as I know? Why would they ask if you had a licence? What if it was registered in Japan? Do they read Japanese? Russian? Makes no sense to ask for a licence? Shows what type of security is at Canadian airports when the person can't tell if you've got a legitmate reciever or a handheld AIR/VHF that could interfere with onboard transmissions. My 2 cents.

hi stephen
I noticed you are using jvfax5.1 the latest version is 7.0 and I can e-mail it to
you if you want it.
Like you I tried to get some sort of picture from a yupi 7100 and a persival
interface, without any success. I think it has something to do with the scanners
bandwidth being to narrow but don't quote me on that.
If you have any success drop a line in the news group. Have you tried taping the signal
so you can try different settings?

I have had experience only with a ratshack, and I am not an expert on
this, but I think it is low sensitivity for a reason. Since it picks
up most of the spectrum including AM and FM and TV broadcast stations
and with the thousands of other transmitters in any city if it were
hi-senitivity how would it decide what frq to read out for you? They
are low sens for that good reason, I believe.

In Indiana (where mobile scanners are unlawfulL)
A friend of mine had one issued by the Cheif of police.
He obtained his by just asking.
(he used to be on the village council though)

It might be like conceald weapons permit you must demonstrate a need.

A lack of permit did not stop me from mobile scanning. I never heard
of it being enforced. I don't beleive the most police or citizens knew the law
existed.

It's already available. Portland (Or.) has a GPS tacking system in just
about all of it's Poilce and Fire vehicles. The bus system is supposed to
get them in a year or two. Theres a problem with it, though. It seems the
poilce union doesn't like the GPS system. They feel that it will be used
to track the officers and monitor their work. So, for now, it's shut off.
I wish they would have thought about this before they spent $12 million
on it. I was wondering if you could figure out a way to tap into the
system and figure out where all of the police are by reciveing the
transmissions. If I can do it, I'm sure some criminal can.

Nothing is wrong with it. I use the Radio Shack discone with the pro-39 with no problems at all. If you lived in a city with all kinds of intermod then you would probably overload the front end.

D Stark (dstark@eznet.net) typed:
: Several states and localities have clauses in their mobile scanning
: laws that refer to obtaining a permit from some authority.

: How likely is it that Joe Citizen can actually obtain one of
: these permits?

Well, I'm in the volunteer fire dept. back home,(Yates County, Finger Lakes region of NY) and one of my friends in a nearby dept. applied for and recieved a scanner permit. I don't know if it was for a mobile (i.e. installed in the dashboard) or for a handheld, but he did get a scanner permit. I guess that the only way to find out how to get one is to go and ask at the local police dept. or the sheriff's office. Only don't use it to go watch them pull someone over, or to find out where they are when you plan to break traffic laws, they don't like it...

Chances are that your listening to DEC encoding. If it is, you can
forget intercepting it, unless your really good at breaking codes!
Motorola Sabers (that scramble) have some very advanced features that
make it nearly impossible to decode any of the conversation.

A couple of months ago I bought a little recharger gaget called
the Little Buddy Alkaline Charger. It supposedly could recharge
ordinary alkalines. Since Toys R Us was dumping these things at
$3 each, I took one on a lark but didn't believe it would work.
Boy was I wrong...the little buddy really works. I also have
the renewal rechargeable alkalines with their charging system
so I could compare results between the two chargers...they are
very comparable. I get about 30-40 recharges with the renewal
alkalines and about 25-30 recharges with the ordinary alkalines,
but at much lower cost. Needless to say I no longer use the
renewal alkalines.

It sounds very much like you're describing Digital Voice Protection (DVP).
There is no known easy way to decode these transmissions due to the
millions (if not more) of possible encryption keys.

The sig is cool! That tactic was also used in the gulf with great
success. I remeber a F-15E crew that was on a scud patrol when they got
lit up by AA radar. Instead of using thier proper call sign, which for
strike a/c was automobile names, they used the call signs of the wild
weasels, beer names. The radar was turned off rather quick.

Bingo! You are right about the receive IF bandwidth being the problem. Satellite weather pictures need about a 400 KHz bandwidth. Too wide for normal audio NFM and too narrow for TV and broadcast WFM. Also don't confuse the Weather Fax signals broadcast on HF with the satellite signals. They are not the same.

For more infomation get the book on Weather Satelite reception by Ralph Taggart published by the ARRL and available mail order and at almost any well stocked radio store.

The bottom line is that you need a special or modified receiver for the satellites.

IG>range should I search to try and find these? I only have a little
info.
IG>on the radios. They are Motorolas. They have the letters 'MTX'
printed
IG>on them. At the top there is a rotary dial, as well as an A-B-C
toggle.
IG>Does the A-B-C toggle indicate each radio can communicate on one of
three
IG>channels? (Someone once told me there are 11 frequencies allocated to
our
IG>company...maybe MIS for a few, security for a few, etc.)
IG>Is there a common set of ranges for these types of radios? Or are they
IG>programmable, so it's wide open.....?
IG>Thanks.

The Motorola MTX come in serveral different models MTX2000, MTX8000, MTX9000, MTX900, MTX800.

Thes radios can be Conventional and/or Trunked. The MTX8000 & MTX800 are 800 band, the MTX9000, MTX900 are 900mhz band. The MTX2000 can be almost any band, VHF hi, lo, UHF, 800, 900

The new MTX2000,8000,9000 are completely programmable. Dam near every knob except on/off/vol can be programmed for a different function! I was one of the first users on the west coast to have the MTX9000's and programmed 45 of them for my company, what a task.

One way of knowing the band is to look at the antenna. I think I should write an article on Antenna Intelligence for Scanner listeners.

Will post some basic info on that subject shortly.

I saw this idea on alt.2600 and figured I would give it a try. It worked and worked well. Can't remember who posted the idea, but I am passing it along as many people seem to be asking about decoding touch tones.

How to use your pager as a touch tone decoder:

1 - Tape the touch tones
2 - Dial your pager
3 - When pager service answers, play recorded tt's in telephone mike
4 - You are paged with the number

Sorry if this has been mentioned before. I have been following these groups for ~6 months and haven't seen it. Anyway, hope this helps.

Cheers,

Rich Creal

I bet you might be able to "jam" their signal without transmitting any
microwave signal. Instead, mount an audio style speaker on the front
of the car, unshielded by grillwork.... The speaker cone should be a
foil covered corner reflector shape. Then vibrate the speaker with
a good high power audio amplifier at ~70Hz * desired Mph. When the
police radar hits this, the usual doppler shifted signal will get reflected,
but it will be modulated with the above audio frequency which may
be enough to fool the radar circuitry into thinking it sees two reflections
and hopefully shows the speed of the slower one. After all, some of
these radars are 'calibrated' by a method similar to this. They put an
audio tuning fork vibrating at a particular frequency in front of the radar
which should show a particular speed. Might be worth some
experimentation anyway...

>And thus the reason that these "codes" are formally known as aural
>brevity codes.
>

Yeah, however the problem that we have here in Arizona is that
departments tend to change their 10-codes and type codes
to the point that when recruits get out of the academy, they
end up having to learn all that stuff over again, even though
they get drilled on a totally different set.

Great example: I teach in the reserve academy for the local
sheriff's office. A shooting victim for us is coded as a 901S.
The largest municipality in our county (Phoenix, AZ) classifies
a 901S as a stabbing victim, or as a 901C (cutting). A victim
with a gunshot wound in Phoenix is classified as a 901G.

Enjoy !

I've not had much experience in this, but I remember that wx sat signals are of a
wider b/w than usual Narrow FM filters, and narrower than Wide FM filters :-(
It should be possible to fit a more appropriate filter IF:

1: you know what you're doing
2: the IF (intermediate freq) is a common one ie 10.7 MHz
3: there is space inside the scanner
4: you don't mind cocking it up.

> If you have any success drop a line in the news group. Have you tried taping the signal
>so you can try different settings?

good idea. BTW if anyone has a hi-fi or stereo VCR, then using that can give better
results than a domestic tape recorder, and you can get a lot more on it. Even a
humble mono VCR can be used as a 3 hr audio tape recorder.

There are NO channels allocated to Raynet only use. There are several channels that are marked as RAYNET channels as what could be seen as a good will avoidance. When we are working we obviously need to go somewhere. Having some sort of allocation means that we can work without getting your hair. We appriciate the free use of these channels when we do work, but always have a secondary channel if our primary one is already being used. I know of one or two Raynet groups that think is is a god given right to use those channels marked for raynet use exclusivly, it is not. The UK scanner directory is wrong when it says that all the Snn channels on 2m are Raynet. I don't have a list to hand but if you check out the RSGB callbook (see a friendly amateur) you'll notice that there are only a few 'Raynet channels'. 144.775 is one that comes to mind.

Yes, Bob Parnass posts them periodically or you can FTP them from:
rtfm.mit.edu /pub/usenet/news.answers/ham-radio

>I'd like to get a scanner in the 50kHz-30MHz range.
>Sure, there are many, but are there any in the $100-$150
>price range? Can a list of specifications for different
>scanners be found anywhere on Internet?

Radios that cover this range are not usually called "scanners" they are shortwave radios. Scanners usually do not go below 25 or 30 MHz. There are a few WIDE BAND scanners that cover 100KHz to 2000MHz, but not in your price range. There are a few shortwave radios in your price range, but you have to know what you are buying first since many of them are junk. I'm sure if you do not get any suggestions here, the folks over on rec.radio.shortwave could help you out.

You are the first person I have seen that has reported that this decive actually works. A few years ago I purchased one and did a controlled test against a set of batteries that were left to recover on their own. The Buddy-L charger showed that it could not do anything the batteries wouldn't do by themselves. The Buddy-L charger says you must not let the batteries drain all the way before recharging them. If you do this with a set of batteries and just set them on a shelf for the same period of time the other set is in the charger, you will find that the two sets of batteries will provide the same useful life. I posted the results of my test to the Internet a while back, which was in turn published in a few newsletters. No one ever said their results were any different from what I had found.

Allowing batteries to sit and recover allows you to get more juice out of them because they do not reach the device cutoff voltage as quickly.

3892. Central PA utility frequencies?

Newsgroup: rec.radio.scanner
Date: 1995-03-24 14:13:29 UTC
From: Dave Shaffer <DCS4@psuvm.psu.edu>
Message-ID: <95083.091329DCS4@psuvm.psu.edu>
Source record: 259661

I'm thinking of adding a bank to my scanner for utility companies. That might be handy at times, and I've never tried it. Could be interesting in heavy snow storms, thunderstorms, power outages of other varieties, etc.

I'm thinking power companies...Penelec, Unilec, and West Penn in my region...Maybe the phone company, Bell for me...Perhaps cable TV provides, TCI in my case...maybe even gas or water.

Anybody have any ideas, frequencies to try, experience listening to those sources? Would it be worth the effort? - Dave

PS -- Maybe I should add that I am specifically interested in frequencies in central PA from State College, Centre County, through DuBois in Clearfield County!

Firstly, do the groups alt.radio.scanner and rec.radio.scanner
have a FAQ?

I'd like to get a scanner in the 50kHz-30MHz range.
Sure, there are many, but are there any in the $100-$150
price range? Can a list of specifications for different
scanners be found anywhere on Internet?

You should get much better reception.

D> Various books suggest that this could cause intermod/overloading
D> problems due to poor front-end filtering on handhelds.

D> This is in the context of a fairly rural area, but with a medium-sized
D> town a few miles away.

In this context, I doubt that you will have an overloading problem. I have a PRO-34 that I can hook up to a RS discone antenna here in Phoenix; no overloading. Intermod is a different story. In certain bands (~450 MHz), pagers make the '34 impossible to use.
The best way to find out, of course, is to try it for yourself.

I'd go the extra 75$ for the 2006 combo. You will get full coverage without the cell lockout. I have the 2006 (also from Grove) and it is an excellent radio. Also what are you using for an antenna? If you're going to spend 600 odd dollars on a system and not get the best antenna, you're not spending the money wisely.
I'd consider a beam of some type, especially if you are not very high up. Otherwise you could get away with an allband vertical or Discone if it's HIGH enough!

Good Luck

I picked up a Motorola HT200 radio at a hamfest with a charger for a steal ($5) thinking I could maybe put mu local PD or Ambulance freq in it (155. or 156. mhz) incase of somesort of life-or-death emerg. Can anyone tell me about this radio, I opened it up and saw a crystal in it for 146.94mhz, was this a ham rig to start, or did someone retune it? The crystal looks like a regular scanner crystal (like RS ones), is that what it is? I can't get it to charge, so I'm going to try feeding power from a supply into it directly.

Thanks

I know this has probably been asked a million times, and I apologize for asking it again but I would really like to know the Secret Service freqs for Bill Clinton's and Al Gore's security. Bill Clinton and Al Gore are coming to my campus (Emory U.) on March 29th for some sort of economic meeting.
Also does anyone know of any other interesting freqs (besides Secret Service) that travel with the president? According to my campus paper there will be about 300 media people in two different designated press rooms. Does anybody know if there are any interesting freqs (besides the standard local news stuff) which will accompany the national press corps? Does anybody know the freqs Air Force Once uses, and any other freqs related to transporting the president.
It should be a day of good scanner listening for anyone in the Emory/Atlanta area. Thanks in advance for any responses.

-Stephan Piel

>it. Kinda makes me wonder.

Actually, that's the only way this device would work. You're basically
topping off the battery, so it must be "recharged" after VERY LIGHT use.
So if you used the battery-operated device a little every day you would
have to top off the batteries every day, too.

>phones, etc.

So far, most of my use of the M-400 (version 2) has been with DTMF (the mode that comes on when the unit is switched on), the pager modes (Super POCSAG is very popular), and RTTY.

The DTMF portion of the unit has a programming mode whereby up to ten DTMF digit sequences can be stored in memory in order that the M-400 might mute the speaker until one of the digit sequences is detected, or until a specified time period has passed, or a button is pushed. With that feature, you might monitor a cordless neighbor with one of your scanners (the one you owned before you bought the AR8000)--only when a certain number, or one of ten certain numbers, is dialed.

The manual carefully describes how to decode Baudot, ASCII, AUTOR (SITOR A & B), FEC-A, SWED-ARQ, FAX, ACARS, CTCSS (PL), DCS, DTMF, and the following pager modes: POCSAG, Super POCSAG, and GOLAY.

I have not yet tried RTTY decoding with my AR8000, but have had good success with my Sony 2010. The manual says this about RTTY: "The Simplex Telex Over Radio (SITOR) code is used extensively in maritime and diplomatic communications . . . . SITOR A is one of the easiest RTTY modes to find and tune. It is easy to find because of the unique chirp, chirp, chirp sound of two stations interchanging data" (13). I found it thrilling to have the sounds I was curious about for so long turn into text before my eyes. The first message I read off the air was from a ship taking in some water. Recently, I read some stock quotes.

The buffer is pretty large on the M-400 (8,000 received text characters), and it is easy to send the output to a printer. I am planning to purchase a parallel-to-serial converter that will allow me to save what I decode to files on my hard-drive.

Here is what the manual says about some of the other modes: "FEC-A is a popular European press and diplomatic mode" (14). "SWED-ARQ is a diplomatic mode used by the Swedish" (15). "Facsimile (FAX) mode is used on shortwave to transmit wire photos, weather charts, maps and other documents" (16). "ACARS stands for Aircraft Communications Addressing and Reporting System. It was developed a few years ago to cut down on

the flight crew workload by using computers on the ground and in the aircraft to exchange many routine reports and messages" (18).

In article <hemstree-2403951415450001@hemstr01.vcd.hp.com>,
Charles H. Hemstreet IV <hemstree@vcd.hp.com> wrote:

>Does anyone have a compilation of the common drive-thru
>frequencies that different fast food places use? (McDonalds,
>BurgerKing, Taco Bell, etc) ...

I've seen compilations, but they are not accurate for more
than a specific set of restaurants in specific locations. That's
because there are no FCC "fast food" allocations as such. The fast food
joints are found on dozens of frequencies, including low power business
frequencies (e.g., 154.6 MHz), conventional business frequencies
(154.515 MHz), and interstitial UHF business channels (e.g.,
460.8875 MHz).

You cannot assume that your local McDonalds uses 154.57 because
the McDonalds in another town uses it. The best way to find
the frequency is probably the most fun way -- take your scanner
or frequency counter on a "frequency hunt." For the VHF-low
band (30 - 50 MHz), you'll have to be very close to hear
the signal, usually right in the parking lot. The VHF-high
and UHF signals can be heard at greater distances.

While testing the Auto Store feature on the new BC3000XLT
portable scanner, I spent a few hours digging up the
freqs for several stores and about 8 fast food restaurants
all located on the same street.

There is another way. You may have already seen my note on
RadioMap(TM) in the rec.radio.scanner FAQ article:

Over 15% of the FCC licenses, including many fast food
restaurants, contain transmitter latitude and longitude but
specify no transmitter city. To determine the location of
those transmitters requires using the latitude and
longitude information.

As I have already done for dozens of radio enthusiasts and
companies in several states, I will locate FCC licensed and
selected FAA transmitter sites in an area of your choice,
and produce a custom report. To make it easy to locate
transmitters, the report includes an 8-1/2" by 11" scaled
plot marked with transmitter sites and cities (no streets).
I call this innovation RadioMap(TM) service.

It allows you to identify antenna sites (including paging and cellular phone cell sites) and visualize the transmitter locations in your neighborhood, near your office, at an airport, and other places of interest -- from VLF through microwave. Industry uses RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites.

This is completely different from, and independent of the Grove Enterprises CDROM.

Ham radio stations are not listed. The RadioMap report includes frequencies, callsigns, and licensee names. For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density. A 5 mile range (100 sq. mi. area) works well in most suburban areas. In rural areas, ranges of up to 10 or more miles (400 sq. mi. area) are possible, while ranges of 1 to 2 miles produce best results in urban cities, e.g., Manhattan and downtown Chicago.

I will produce custom RadioMap reports for areas in any of the 50 states. Send $25.95 (check or money order) for each RadioMap report, your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM central time.

Note: I cannot respond to electronic mail inquiries about RadioMap. Please call the telephone number above if you have questions.

I have travelled all over the U.S., including Los Angeles, Big Bear, CA, Phoenix, Arizona (where I live) and San Antonio and Austin, TX. And whenevr I drove by a McDonald's, they used 154.600 and in a few cases 154.57 but it was ALWAYS one fo the two, and they always used a CTCSS of 107.2Hz

But you've cited only a tiny percentage of McDonald's restaurants.

Had you driven through southern Naperville, IL, you'd find
McDonalds on 171.105 and 171.905 MHz, and on 151.895 in
other parts of town.

And then, there's the Homewood McDonalds on 170.245 MHz and
the Downers Grove McDonalds on 467.55 and 457.55 MHz....
or the St. Charles McDonalds on 464.5125.

And then there are the 6.02*10**23 McDonalds in Chicago, ...
I think you get the picture.

>price range?

.05mhz - 30mhz is typically refered to as the Short Wave band. Few scanners really don't do well in this band, most don't even try. The ones that do, are going to cost $400- $650. What you need is a cheap portable Short Wave radio. Even so your price is awfully low to get anthing decent in my opinion.

It also is largely up to the whim of the person making the decision. I know several people who wanted to get a permit in Clarksville, IN, and were flately told "no" with no explanation. Atleast in the copy of the Indiana law that I have, no policies or requirments are set. It seems to be left solely to the person who must make the decision.

A MUCH easier route is to just study a few weeks and get your Technician class ham radio license (no code test for this one). Indiana (and all states that have scanner laws) specifically exclude hams from scanner restrictions. City and county laws may be an additional hurdle though, depending on where you live. But I've not heard of that many entities smaller than "state" that have scanner laws.

well good new i have a list of air lines that will let you carry and
listen to a scana on board your flight....

Air new zealand ....yes with no stipulations.
ansett... no but they will test radios for iterference and answer maybe
changed to yes..

DELTA..... yes but only in cruise.

KENDALL..... yes if no passanger discompotr is caused and the captin ok's it.

KLM (holland)......NO

LAN CHILE.......NO

LUFTHANSA.....NO

O"CONNOR AIRLINES.........YES IF EAR PHONE OR HEAD SET ARE USED.

QANTAS...NO THEY USED TO TEST RADIO FOR INTENDING PASSENGARS BUT HAVE
STOPED TO ECONOMISE.

SINGAPORE AIRLINES....NO

well this list was taken from listening in magazine they can be contacted
at PO Box 16 georges hall 2198 NSW AUSTRALIA.

These statements always get my curiosity going. I am a pilot and I have never had
a problem with any scanner interfering with navigational equipment. In addition,
I have used a cellular phone, which by the way, don't you wonder why they say you
can't use your cellular phone due to possible navigational interference when they
now have cell phones in the back seats which you can use your credit card to
make phone calls!

Another bunch of crap put out to make money for the airlines!
WAKE UP AMERICA!

Hello,

I will be travelling to the Baltimore/Washington DC area (near NASA/Goddard) next week and am wondering where I can buy a Uniden BC3000XLT. I know about EEB and HRO in Virginia, but unless they have nighttime hours, I won't be able to get there while they are open. Are there any electronics stores near where I'll be that I could get to quickly or have night hours? I am leaving for there on Sunday the 25th. Thanks...

BTW - Anyone in that area interested in buying a mint ICOM R1 with BP84 pack and soft case for $350 (firm)?

What you should have done was de-solder the diode instead of clipping it. That way you could have jusr re-soldered it to the radio prior to shipping back to radio Shack.

Rat Shack will restore the diode you clipped, then charge you for this
'repair'. They will restore the unit to origional specs....

Had a friend with a computer, that he installed a 3rd party memory board...
It broke down, and he brought it in for repair. They restored it... by
throwing away his $200 memory board and charging him to replace the origional
memory chips.

From: professr@netaxs.com
Message-ID: <3l1u3q$2qk@netaxs.com>
Source record: 259521

I have a 1500 Watt linear Amplifier that was featured in the 1995 ARRL Handbook. (page 13.31) It covers the 80, 40, 20, 17, 15, 12 and 10 meter bands. It produces 1500-W PEP with about 100 watts of drive. It runs on 240v and is very easy to tune up. The power supply is built in. I am interested in selling for $1500.00 or best offer.

It uses 2 3-500Z triodes.

3950. Phone monitor

Newsgroup: rec.radio.scanner
Date: 1995-03-25 20:30:43 UTC
From: buygold@aol.com
Message-ID: <3l1uhj$gap@newsbf02.news.aol.com>
Source record: 259522

Help! I am searching for a telephone listening device. This device has been used in the
past by both the CIA and the FBI. It allows you to call a phone number and open the
circuit without requiring either the phone to be lifted off the cradle or cause it to ring.
Therefore, every phone on that line becomes a microphone. It also does not interfere with
the normal operation of the phone. Obviously, the local Radio Shack store isn't going to
carry these in stock. I also imagine it is illegal to use this device on anybody else's phone
except there own. Of course, I would only use this device for testing purposes on my own
phone. Can anyone help me find either the device or the plans for one?
Please E-Mail me.

> difference?

By a "real" scanner I meant one that is user programmable and no, a real scanner won't help you anymore than the Beartracker if the officer isn't using the extender, i.e. if he's NOT outside his vehicle.

It's just that the Beartracker's main selling point (the alert feature) has been severely limited by the fact that those states using mobile extenders have now configured them to be turned on only when the officer is out of his car. So, since most police patrol cars you see have the officers inside why bother buying a radio whose main feature is for the most part hype and at best undependable?

BTW, the Beartracker model BCT-2 is NOT user programmable, meaning the user has no way to change frequencies. I was thinking of the BCT-2 when I originally said get a "real" scanner. The newer Beartracker BCT-7 is user programmable. So it, at least, does have redeaming qualities regardless of the alert feature.

My overall point is that whoever buys either model Beartracker figuring that the alert feature will tell him whenever there's a Smokey within 3 miles is buying false security.

I believe that device you are refering to also plugs into an AC outlet
and uses PLC techniques to connect the jack and the phone. Therefore,
you are unlikely to be able to monitor those communications.

3960. Re: Rechargable alkalines Better?

Newsgroup: rec.radio.scanner
Date: 1995-03-25 23:26:42 UTC
From: ingallsd@iea.com
Message-ID: <3l28ri$n3b@krel.iea.com>
Source record: 259531

In article <3kpulv$nte@pioneer.uspto.gov>, smeier@uspto.gov (Stephen Meier) says:
>
>Are the rechargeable alkalines worth the investment? I've already spent a
>small fortune for an arsenal of the "Millenium" Ni-Cad's. I feel they are
>OK, but for things like flashlights that sit around for 6 months, you still
>can't beat ordinary alkalines.
>
>Is there any difference between an ordinary alkaline and a rechargeable one.
>I think the technology lies in the charger not the battery, but I'm not
>sure.
>
>Any brand name suggestions?
>
Rechargable alkalines can only be recharged 25 times. Their capacity on
the 25th charge cycle is substantially decreased (relative to initial).

Properly maintained NiCad's can easily provide 500+ cycles. The cost of
of NiCad cells is about 2 or 3 times that of rechargable alkaline cells
(can't find my actual price figures right now). So obviously (you do the
math), you will spend substantially (and that's an understatement) more
money using rechargable alkalines than you would using NiCad's.

Using NiCad's does require a small amount of intelligence on the part of
the user (and appearently that task is beyond many in this news group).
The main problem experienced by NiCad users can be avoided by removing
charge current when cells are charged - don't allow them to trickle
charge for extended periods. Also, it is prefered that NiCad's be allowed
to fully discharge occassionally.

As you noted, some applications are more easily accommodated using alka-
line cells. These applications are long standby situations. This is due
to the self discharge characteristic of NiCad's. NiCad's will self dis-
charge (to half capacity in approximately 1 month @ 25 degees C or in
1 week @ 40 degees C.

Good Luck,

Dave KB7ZEK

3961. Digital information prece

Mu> The county police where I live have some sort of digital
Mu> information which is transmitted from their car's radio every time
Mu> they transmit. Is anyone familiar with this? What information is
Mu> contained in this signal? (I assume it informs the base station
Mu> which car is calling, and logged into the computer automatically)

You are correct. It is especially useful during an emergency situation, when an officer is down or there is a stuck key, etc. The IL State Police and the Chicago Police use these. Some of these units have come out into the used market, so ham radio operators are picking these up and programming them for the amatuer band.

Mu> Also, what kind of signal is it? It isn't digital like what I am
Mu> familiar with. It doesn't sound like Amateur Packet Radio, which
Mu> sounds like what digital information from you PC sounds like. It
Mu> sounds more like a series of evenly spaced tones, but all of the
Mu> same frequency. So it isn't just a very quick DTMF.
Mu> What is it?

Not sure exactly what it is. I suspect it is a proprietary scheme.

By the way, I also understand that the computer not only logs in the radio that is transmitted, it also logs in the site that the radio accessed. So if there are multiple repeater sites, the closest site that is accessed will be logged into the database.

Ro> I just had my Bearcat 2500XLT stolen, so I guess I get to shop for a
Ro> new scanner. Does anyone have any thoughts on the new Bearcat 3000 vs
Ro> the AOR ? I saw the Bearcat for $399 at scanner world, I don't think
Ro> any of the AOR scanners are under $600. How is the 3000 better than the
Ro> 2500 ? I really liked the 2500, so I'm considering going with the 3000.
Ro> Computer control would be nice though...

Sorry to hear about the 2500. Although my experience with the 2500, I
would be happy if someone stole it. <g>

In any case, the 3000 is supposed to be alot better than the 2500. If
you can get a copy of the April issue of Monitoring Times, I suggest you
check out the review. The reviewer liked it so much, he bought one for
himself. And, there are several undocumented features that are not listed
in the manual. These include having the display lit up at all times
instead of timing out, changing the delay time from 2 to 4 seconds in DELAY
mode, a disable of sort capability, and the display segment test.

Unfortunately, cellular is blocked, but can be received via the image
method.

From what I hear, EEB has the unit for $369...1-800-368-3270 is the order
line.

Source record: 259532

I have a really mint 2006 for sale - still smells new! Complete with manual and box, etc...

It's illegal to own anything even resembling a scanner in the country that I'm emigrating to, so unfortunately, I can't take it with me.

Well, you can have it for 200 pounds sterling.

Remember, it's as new.

Cheers.

3964. RE: HOW POLICE RADAR WORK

Newsgroup: rec.radio.scanner
Date: 1995-03-26 01:06:50 UTC
From: attgeorgew@aol.com
Message-ID: <3l2ena$kcg@newsbf02.news.aol.com>
Source record: 259534

On 21 Mar 95 01:25pm, ATTGEORGEW wrote to ALL:
A> Not true. The moving source emits a single carrier. Some of that signal
A> is reflected by stationary objects and some of that signal is reflected
A> by the target. Because each of those items is moving at different
A> relative speeds, two different Doppler-shifted signals are reflected.
A> The source again mixes the reflected signals with the transmitted
A> signal to get the difference frequencies. A little signal analysis
A> determines the difference between the two speeds to get the speed
A> of the target.

bill.funk@iotp.com (BILL FUNK) replied:
>That won't work. Unless the stationary source is either dead ahead or
>astern, then the speed of the transmitting vehicle can't be determined with
>any real accuracy, unless the radar unit has a way of inputing the angle
>of the stationary object "off the bow", and they don't.

It *does* work and that is exactly how. There is always a stationary object
dead ahead - the road. Radar units are directional. Thus, objects "off the
bow" have a significantly reduced reflected signal and usually do not
affect the accuracy. There are circumstances where a highly reflective
object (like a metal sign or a truck) "off the bow" can induce an incorrect
reading, but try telling that to the judge.

bill.funk@iotp.com (BILL FUNK) also replied:
>The way I described moving radar was gotten from the Santa Rosa Police (Ca)
>about 15 years ago. This was the only way to get an accurate speed of the
>transmitting vehicle then, and I don't think the technology has changed

>*IS* possible, and more sophisticated radar units do this all the time,
>space and $ prohibit it's use for traffic law enforcement).
>Interesting.

I no longer have your description so I forget what you said, but what I
vaguely remember that you said the unit transmits two signals - one at
the ground and one at the target. Technically, it transmits only one
signal.

But because that signal takes two paths (to/from a stationary object and to/from the target), you could argue that there are two signals. I'm not sure that I'm contradicting your article; I may just be contradicting your interpretation.

Police radar makes no calculations or adjustments for angles. It works on simple principles and is not very sophisticated. That is was makes it inexpensive enough that every police force can afford one (of course, the way they give out the tickets, you would think that they could afford to mount the Hubble space telescope on every police car). ;)

3965. Which RS Scanner to Buy?

Newsgroup: rec.radio.scanner
Date: 1995-03-26 03:07:13 UTC
From: Brian Feeny <sigint@delphi.com>
Message-ID: <ZmyaPKp.sigint@delphi.com>
Source record: 259535

I was wondering if there is ANY RS scanner currently being sold at RS
that can be modified to receive cellular?

I would like to buy a NEW scanner from RS, and I was wondering what the best
one to get would be, celular isnt really THAT important, just would be nice.
I scan al over listening to all kinds of od things, I listen to police,
and the air force, cordles, pagers, business, etc. whats the best bang for the
buck?

Brian
(i am using RS charge, so that is why it must be at RS now)

According to the local guys here in town, no. There's
supposedly no official policy to restore blocking, but that doesn't
mean it can't happen. At least on the 2006, unblocking it again
is incredibly trvial.

I wouldn't worry about it. When you bring in the radio, make
sure you have them note it on the repair ticket. Unfortunately,
the repair may be to replace the whole keypad and I seriously doubt
that they'll clip the diode on the new one for you.

The screen on my 34 cracked once and I sent it in (with a cellular mod and I even had a hole drilled in the top where I tried to install a switch - I have a light switch there now.) My understanding at that time is if the mod didn't cause the problem, they still honored the warranty. That doesn't mean that they still feel that way or that every repair shop will feel that way. Why not re-solder the diode before sending it in?

MH> Sure, there are many, but are there any in the $100-$150
MH> price range? Can a list of specifications for different
MH> scanners be found anywhere on Internet?

That frequency range is HF, and scanners don't receive exclusively HF. You'd need to get a "full frequency" or some-such named scanner.
Actually, if that band is your main interest (instead of asking what scanners will receive that range), you will be much better served with a short wave receiver.
Actually, any scanner that will cover HF as well as UHF & VHF will do rather poorly on HF compared to even a cheap SWR. Their only advantage is that they will cover all three within one case.

3988. Help with the PRO-51

Newsgroup: rec.radio.scanner
Date: 1995-03-26 22:55:03 UTC
From: why?
Message-ID: <why?-2603951655030001@mario01.ppp.ncsu.edu>
Source record: 259567

Ray Rome and Bob have written about some cellular mods for the Pro-51, but they have not worked on my scanner. It is a Pro-51 with 8A4 stamped on the back, and when I perform both of the written mods, my Channel 23 displays 857.2125 and will not access the blocked out freqs. I am assuming I am doing everything correctly: holding down the specified keys, then using "manual" to get to channel 23, then using the up and down arrows to try and find cellular. Please help me, and thanks in advance.

Want unrestricted 800MHz operation for the PRO-2027? Move diode D35 to
the D34 slot. D34 is open on USA/Canada models. Be careful soldering
here, the diode is a bit small.

Anyone seen a mod for the PRO-2032? Can it even be fixxed for the
800MHz "business band?"

Scott

3990. pro-2032:cellular mod?

Newsgroup: rec.radio.scanner
Date: 1995-03-27 00:00:00 UTC
From: ray_reese@tscnet.eskimo.com
Message-ID: <5d.3282.1921@tscnet.eskimo.com>
Source record: 259552

```
Radio Shack PRO-2032 Base Scanner
---------------------------------

This scanner is simular to the PRO-2022, but with HyperScan as in the PRO-2006.

Tools Needed:
------------

1. Small-Tip Soldering Iron 2. Small Guage Rosin-Core Solder
3. Desolering Wick 4. A Phillips Screwdriver
5. 1N914 or 1N4148 Switching Diode

Cellular Modification:
---------------------

1. With scanner unplugged, remove both upper and lower covers (four screws in
the rear of the cabinet), taking care not to damage the speaker wires.

2. Set the scanner upside-down with the back facing you. Locate the micro-
processor shield (upper left corner near the volume and squelch controls).
Unsolder and remove the shield.

3. Refer to the diagram and locate the three-legged diode at the lower right
of the microprocessor chip. Carefully unsolder and remove this diode.

4. Refering again to the diagram, place a 1N914 or 1N4148 switching diode
across the solder pads as shown (note correct polarity!); remove any excess
leads and carefully solder it in place. Be sure it's leads will not contact
any other components, paths or the reassembled shield. A small piece of
non-conducting tape may be placed on the bottom of the shield if necessary.

5. Plug the scanner into pwer, turn it on and test it by entering 869-894 Mhz
cellular frequency into the scanner.

6. If successful, unplug the power and reassemble the shield and cabinate. The
will now operate normally with no breaks in the cellular telephone band, in
which it will search in 30 Khz steps.

DIAGRAM/LOCATION OF PADS FOR CELL MOD:
--------------------------------------

_______________
[ ]
[ ]
[ IC-6 ]
[ GRE-9108a ]
[ ]
[_____________] Dual Diode D-29
[ ]==
```

Squelch Modification:
---

1. While the scanner is apart, locate the squelch chip IC#3361. Locate, unsolder and remove the surface mount resistor between pins 12 and 14 of the squelch chip. Replace it with a tantalum capacitor, the positive (+) soldered
to pin 14 and the negative (-) to pin 12.

2. Squelch sensitivity will be much improved, with just a slight squelch tail and hysteresis.

---
* Article from: Monitoring Times, June 1994, Page 112, Bob's Tip of the Month *

UPDATE: The World Scanner Report

Squelch Modification:

Remove the surface mount hysteresis resistor from pins 12 and 14 of the MC-3361 NFM Discriminator chip with a 200K trimmer potentiometer. Adjust the pot. to suit your tatse for a tighter squelch.

Excerpt from WSR regarding MT's squelch modification:

"Frankly, I see no point in that approach which would be the same as just removing the resistor altogether. The trim pot will afford you a range of adjustment to suit your preference. Too tight of a squelch is terrible when weak signals are being detected....sounds like a machine gun as the squelch kicks in and out. Also see V1N2P8, V1N4P2 and V4N3P3 for even better squelch mods for the PRO-2032 and most other rigs." However, "This one will get you by, though, if you don't have any higher ambitions".

==========

BTW, I have one and the mod works. However, I did not do the squelch mod 'cause it seems to work fine as it is. If you like to tinker, make the mod and let me know what difference you noticed for yourself.

Source record: 259570

I have a modded PRO-43 with lots of accessories that I'd like to sell..
As you all know at Radio Shack these things go for a high price and I've tried to tone down the price with "depreciation" and all..

It recieves the entire 800 band, courtesy me, and for the unit itself I'd like to ask 275..
I also have a car adaptor, an AC adaptor, rechargeable batteries, Police Call (MD, PA, DE) and Beyond Police Call (entire USA)..
(I also have a single-ear earphone good for walking around with it hidden)..

For all this, I'd offer 300.. all new the entire package would cost prob a little over 400 ..
If you give me a good reason why it should be lower, mail me, I'm a very negotiable guy..

Mail me if interested, tmfreeman@delphi.com

Thanks
Tim F.

> band. I recomend buying an antennia from Radio Shack for the lower frequ.,
> Really makes a difference.

It works great for me. It does have intermod deep in the big cities but
for $200, I couldn't beat it. I still haven't filled all 200 channels.

Gripes:
--Search is a bit slow, I'd like a faster search especially in the 800MHz.
--The LCD light only stay lit for 15 sec (anyone have a mod to keep it on?)
--A bit noisy sometimes.
--Keypad is a little small.

It's not a bad little scanner, especially if you're on a budget. We can't
all afford an AOR.

3996. Nassau County Question

Newsgroup: rec.radio.scanner
Date: 1995-03-27 02:51:36 UTC
From: Dick Dillman <ddillman@igc.apc.org>
Message-ID: <APC&1'0'7cbf1eab'ce4@igc.apc.org>
Source record: 259376

I've just returned from a visit to Long Island to see the folks. Naturally I took my PRO-43 along to keep tabs on the happenings in Nassau County. I have a question I hope more frequent listeners to the NCPD can answer. When a car is dispatched to a burgular alarm, the dispatcher advises whether there is a permit in effect. My question: A permit for what?

First I thought it was for the alarm itself. But why would you need such a permit even in up-tight New York, and why would the cop care. Then I thought they were referring to weapon permits. Certainly the cop would want to know about these. But almost every alarm had a permit in effect and that's a lot of guns - for up tight New York. So which is it? Or is there a simple explanation I've missed.

By the way, I grew up listening to the NCPD's KEB-237 when they transmitted around 2.7MHz in the MF range. Anyone else go back that far?

Regards,

Dick Dillman

3997. Preamp for Pro 62

G> Sent it in and it came back "fixed". Now it is totally unmodifiable and
G> blocked. They replaced the "third" board (where the CPU and diodes are).
G> I am considering litigation :(

Hmmm... unusual, to say the least. Radio Shack won't do any repairs that they consider not necessary, especially under warranty, when they foot the bill. Given that, you might ask WHY they replaced the board. You never know, it may be that the bulb wasn't burned out, but rather that there was something on the board that required a replacement. They certainly didn't do it to keep you from tuning the cell frequencies, as that's not a requirement for them, and they are not going to spend money they don't have to to piss you off.
While litigation is certainly an option, it is expensive. And, Radio Shack does reserve the right, under the warranty, to fix or replace at their discretion, so you might not have anything to sue for. Especially since the only difference is your ability to tune to cell phones. While that is not illegal, per se, it *does* lead to listening to cell calls, which *IS* illegal here in the U.S.
Also, Radio Shack would see the replacement of the new board as an upgrade, which would, in their view, enhance the value of the scanner (I know, I know.. I'm just looking at this from all sides), which any court would see in a favorable light.
If you DO decide to try a legal avenue, I'm sure we'd all like to hear of any developments. My thoughts are just that: thoughts. I'm no lawyer.
Good luck!

OK, no flames...
How about a Hot Foot?
Anyway, I have friends who ask me why I listen to the police. Even after they hear a high speed chase, culminating in a major accident and foot chase and search involving K-9s, they still didn't want to get involved with listening. Just wasn't their cup of tea.
So, in the same fashion, you don't get turned on by listening to fast food drive-in chatter. Neither do I. But if that's what they want to listen to, let 'em.
While they are counting Big Mac orders, we'll listen to the good stuff! ;-)

Source record: 259378

Hi

I ride Skytrain (Vancouver BC's Light Rail Transit system) each day to and from work. During the odd trip when Skytrain's computer controlled guidance system takes a powder, (or other bad things happen) my Pro43 lets me know what's afoot.

Sometimes, a Skytrain employee boards the car I am in. Although I I can hear him/her conversing over their radio, I don't have the frequency, because I fail to pick them up. Has anyone taken a frequency counter aboard Skytrain and gotten a more complete list than this?

Vancouver Transit Skytrain Announcement 411.0625

Vancouver Transit Skytrain 29 Stn F1 410.0625

Vancouver Transit Skytrain F3 Police 410.4875

Vancouver Transit Skytrain Security 410.6250

Vancouver Transit Skytrain 431.8875

Vancouver Transit Skytrain 431.6875

Vancouver Transit Skytrain Main Street 460.3375

Vancouver Transit Skytrain W/F Stn F2 410.2875

Vancouver Transit South Ch5 (T5Z) 410.4125

Vancouver Transit 410.7500

Vancouver Transit 410.7750

Vancouver Transit Ch2 (T5Z) 411.0875

Vancouver Transit Ch3,4,6 (RT5Z) (T1A) 410.0875

Vancouver Transit Ch5 Backup 410.1000

Vancouver Transit Downtown Ch 1 (T5Z) 410.7625

Rest assured, a frequency counter is on my Christmas list...

4005. Wanted Mods for PRO2027

Newsgroup: rec.radio.scanner
Date: 1995-03-27 05:38:53 UTC
From: 92003623@white.lambton.on.ca
Message-ID: <3l5j1d$sm5@white.lambton.on.ca>
Source record: 259381

Here you go here are the modifications that you asked for, for the
PRO-2027 scanner and this one works. It will restore your 800 mhz
band (the cellular phone part). And yes this works as well I did it
to mine. All I did was destroy that one part mentioned with a pair of
wire snips as well instead of unsoldering it. It is a surface-mounted
component and is hard to unsolder. That way works as well. Anyways here is
the modification.
Jamie

Here is one that I got from an unknown source. This is done AT YOUR OWN
RISK.

RESTORATION OF CELLULAR FREQUENCIES FOR RADIO SHACK PRO-2027

For those that are interested, the following modification will
enable uninterrupted
reception of the 806MHz - 960Mhz spectrum. This modification may
be useful to those
who use a scanner in conjunction with down converters for
satellite monitoring.

Be advised that this modification enables portions of the 800 Mhz band that
is illegal to monitor under United States Federal law.

With the advertisements out of the way here's how its done.

1. Unplug unit. (Obvious but I must say it.)

2. Remove bottom panel (4 screws)

3. Locate diode D35 located behind the enter key. This is a
surface mounted component
that resembles a tiny black square.

4. Unsolder D35. I prefer to unsolder one leg so that the
original functionality can be
restored for resale. This can be done by gently prying up the
component with a pin or
tweezers while touching one leg with a soldering iron. Don't
apply too much heat a 15 - 20 watt soldering iron is more than
adequate.

5. Button it up and turn it on. No reset is needed.

From: ad225@detroit.freenet.org
Message-ID: <3l5jqs$2fe@detroit.freenet.org>
Source record: 259384

The wireless mic frequencies vary from area to area. The various
TV stations in a market coordinate which frequencies they use
so as not to interfer with one another while covering the same
story.

Frequencies range from the VHF spectrum, as noted in the previous
posting to the 500 mhz range in the UHF spectrum.

As one might expect, the range for such transmissions is short
because they need only to project the signal from the mic to
the camera which is, of course, always located in close proximity.

Putting an antenna in the attic will not *prevent* lightning strikes,
only (greatly) reduce their likelihood. A wood roof with a nice
ground plane in it could be the 'easiest' path.

Even w/o a direct hit, inductive voltages could be enough to fry
something...

> These statements always get my curiosity going. I am a pilot and I have
> never had a problem with any scanner interfering with navigational

Same logic as: "I never had a car wreck ... so they do not occur!"

Also, private planes (or military) and commercial have vastly different
electronics.

You seem willing to risk ~200 of other peoples lifes in order to
listen to a few air-ground communications? [I do not care if you
wish to risk your own, just others without their consent].

> I have used a cellular phone, which by the way, don't you wonder why they
> say you can't use your cellular phone due to possible navigational
> interference when they now have cell phones in the back seats which you
> can use your credit card to make phone calls!

1: the phones in the back are NOT cell phones. they work on diff. freq.s
and have been certified safe. they could easily have different IF's
(etc) that are designed not to cause interference.

2: the receive sites know that the phones are 'above' and will not
cause multi-cell disruption which can occur. the handoff (...)
algorithms are different. Other things like power levels and
harmonic tolerances *may* be much tighter.

> Another bunch of crap put out to make money for the airlines!
> WAKE UP AMERICA!

Knowing what you are talking about is useful before calling what
other peoples work crap. Readers with the right backgrounds will
know where the crap is coming from, unfortunately, others may not
and do stupid thiings like use their cellular phones from planes...

DE>steal ($5) thinking I could maybe put mu local PD or Ambulance freq in it
DE>(155. or 156. mhz) incase of somesort of life-or-death emerg. Can anyone

Well you just might find uyourself in a heap of trouble for your
troubles. Why not 1) get you ham licence, or 2)get a cell phone for
emerg. You don't even need to activate it.911 works on c-phones without
service.

DE>tell me about this radio, I opened it up and saw a crystal in it for
DE>146.94mhz, was this a ham rig to start, or did someone retune it?
It was proboly a comercially used rig, bought as scrap by a ham and
retuned.

DE>what it is? I can't get it to charge, so I'm going to try feeding power

That's why it only cost you a fiver!

Lowe Electronics now have a home page on the World Wide Web

Its' address is http://www.demon.co.uk/lowe/index.html

At the moment it is not very big, as we have only just taught ourselves to write in HTML ! However, we will be expanding it considerably as time goes on, with the intention of eventually having our entire catalogue of receivers, scanners, ham radio equipment and accessories available on line.

We will also upload onto it technical reviews, articles on antennas, decoding, etc plus in depth reviews (not done by us) of our own receivers.

We welcome any comments from users as to the type of information that you would like to see there as the database slowly builds up.

Thanks for reading this.

I recently picked up a Ramsey Scrambler/Descrambler kit at a Hamfest. Has anyone had any luck with these items. A few channels I monitor (Public Service bands in the ~155 MHz range) have that "duck-talk" speech effect. Don't want the Ramsey S/D (SS 70) for any fancy or digital, etc., just plain descramble of this "duck-talk". Will I have any luck guys, or will I just learn how to assemble a neat little Ramsey kit.

Any comments on this newsgroup would be appreciated.

Thanks, and Happy Monitoring ......

|> alarm, the dispatcher advises whether there is a permit in effect.
|> My question: A permit for what?

<snip>

Here in Houston we are required to have a alarm permit for home alarm systems, the permit fee is 10.00 per year. If you have a permit and the PD responds to your home you get three freebies for false alarms, if you don't have the permit they nail you for 50.00 for the false alarm and 20.00 for no alarm permit. And they can have your alarm shut off for lack of premit. Our subdivision was anexed on Jan 1, many folks are hot about it, many refused to pay the fee and their systems were de-activated on 3-20-95. HPD send several notifications via the mail to all alarm system owners inb the anexed area.

Over 80% of alarm calls to HPD have been false alarms, they are sick of dispatching units to FA, now the alarm owner has to be a bit more responsible with his or her alarm system.

Im not real happy about the fee but I see their point...

SCAN ON !!!

Now I'm going from my "memory" here Ed, but here goes.

Pgh. Police:

453.10 MHz
453.25
453.40
453.45
453.55
453.95

PA State Police: (Mobile Scanners ARE legal)

PA. Turnpike Operations:

154.755 MHz Aircraft / Radar / Car-to-Car
155.460
159.210

also, 159.000, 159.045, 156.195, 159.075, 156.225 .

The Pa State freqs. are from a list; the Pgh. Police are from my memory.

REMEMBER ....

BUCKLE UP and OBEY OUR SPEED LAWS ... IT'S OK TO MONITOR; NOT TO MASSACRE !!

the FCC does not allow any marine communications from an automobile. It is in fact illegal to transmit on marine frequencies from an automobile. A 2 meter antenna will work well for receiving purposes however.

From: Vaughan.Huska@odxabbs.tor250.org
Message-ID: <d35_9503272007@tor250.org>
Source record: 259387

Hi ya.

RF mics are not exclusive to the 181.XXX Mhz frequency you quoted. Nor is it exclusive to see the frequency of the TX (mic) pack written on the inside of the battery compartment.

Many of the wireless I use here in Toronto are quite varied. I have used mics in the 180 Mhz range like you have seen. The next day I might be using a kit that is in the 700 Mhz range and still the next day might bring on a kit that that is in the 600 Mhz range. As you can see, there really is no "set" frequency range for RF mics anywhere in North America. It all depends on who is using what and where. And what make and model you like. It's up to your discretion and of course, cost. The higher the frequency, the higher the cost it seems.

Also, the frequencies (sometimes there are 2 for true diversity kits) for TX are sometimes printed right on the TX/mic pack if not on the RX pack itself.

Today I was using a Cetec Vega kit that had the TX/mic pack using 184.3250 Mhz (there I told ya). What do you think your chances are of tuning into a "talking head" next time you're near a TV shoot on that frequency? Damn near nil probably as my Cetec Vega is about 6 years old.

Anyway, they all vary and no two are the same or allocated to one user.

Cheers,

Vaughan

FWIW, the Remington NuPower Alkaline battery charger actually does a very good job of rechargin standard alkaline batteries. Not as good as the Renewal system, but if you go on using standard alkalines then the Remington charger would be very handy. Even of you get 5 recharge cycles it still justifies the $10 price at Walmart.

>

NiCads have a lower nominal voltage (<1.3v) and this can degrade performance
of electronic equipment, unless specifically made to work in a low voltage
environment.

I've always used Nicads until recently. The Renewals are a nice, low
cost alternative to Alkalines and Nicads. Much more predictable to use.
No performance impacts by recharging before discharged, unlike nicads.
Makes topping off before use very convenient.

Andy

Actually this is true, some older units (1970's era) did work this way,
emitting two signals. These units were retired because they did not always
work properly (sometimes the signal that was supposed to hit a stationary
target hit a moving one), and gave many false readings.

>Not true. The moving source emits a single carrier. Some of that signal
>is reflected by stationary objects and some of that signal is reflected by
>the target. Because each of those items is moving at different relative
>speeds, two different Doppler-shifted signals are reflected. The source
>again mixes the reflected signals with the transmitted signal to get the
>difference frequencies. A little signal analysis determines the difference
>between the two speeds to get the speed of the target.

None of the 1 signal units I have ever used worked this way. They were
incapable of tracking multiple targets. They worked like a CB radio
receiver, picking up only the strongest signal. That could be a car right
in front of you, or a truck 1/2 mile down the road.

The unit in your example fails for the same reason the 2 signal units did.
How could it differentiate between a stationary object and slow moving one?
It can't. The reason 1 signal units are able to get a readout while in
motion is due to double doppler shift.

>You must have been a radar tech in the military or maritime because you
>don't know squat about how police radar works.

...

>I hope you know more about law enforcement than police radar.

You are coming up a little short on the facts yourself. And there is no
reason to make a personal attack on someone.

No, each vehicle accurately picks up the speed of the other vehicle. This
happens every time a patrol car passes another patrol car, using like
units.

First, the unit does not disperse too wide a pattern. Units I have used
typically were around 15-20 degrees or so. Second, while you do lose some
accuracy, it is insignificant. Third, angles always favor the target.

The newer model, the SS-70, works quite well. It seems to be filtered much better than the previous model (SS-7 I think).

For the application I was using it for, the supplied crystal wasn't precisely where I wanted it; the inversion process took place but it was still a little "high" or "low". By experimenting, it turned out that replacing with xtal with a 4.7500000 MHz one (from R.S. of all places) put it pretty much on target.

Have fun!

ECI makes the Digital Data Interpreter (DDI) which decodes and displays cellular phone data and can be used to control many scanners to allow them to follow calls that change frequency, etc.

They sent me the following info which I am passing along for information. I don't know anything
else about it; please contact Mr. Fischer for additional information. From previous discussions
I've read here in rec.radio.scanner, ECI's pager decoder is supposed to handler the higher baud POCSAG signals that are not handled by the Universal M400.

4053. Balloon Launch April 8 - Wisconsin

Newsgroup: rec.radio.scanner
Date: 1995-03-27 22:34:29 UTC
From: djmullen@facstaff.wisc.edu
Message-ID: <3l7ehl$2c6@news.doit.wisc.edu>
Source record: 259340

Midwesterners: Here's something different to listen to on your scanners. We expect a 250-400 mile range, depending on how high the balloon gets. The voice signal will be standard narrow band FM. The receiver for the crossband repeater will be a Radio Shack Pro-50 pocket scanner with a rubber duck antenna.

- -

The Badger Amateur Radio Society and the High Altitude Radio Project announce
The Launch of the BARS 1 Weather Balloon

Launch Date: Saturday, April 8, 1995 (Rain dates April 9 and Easter Weekend)
Launch Time: 9:00 - 10:00 AM CDT (14:00 - 15:00 UT)
Launch Site: Hillsboro, Wisconsin (About 20 miles W. of Wisconsin Dells)

ATV transmit freq: 439.25 3 watts Color
GPS/APRS Packet TX: 441.05 2 watts 1200 baud packet
Cross-Band Repeater Output: 439.25 3 watts FM (Same as ATV output)
Cross-Band Repeater Input: Two Meters - frequency to be announced.

Note that the crossband repeater output and the ATV transmitter are on the same frequency. The ATV transmitter's carrier is FM Modulated with the voice signal. The voice and TV signals don't interfere with each other.

This flight will be BARS' entry in the 1995 University of Wisconsin Engineering Expo, a bi-annual display of student engineering prowess that is scheduled for April 21-23 on the University of Wisconsin, Madison campus.

This will be a weather balloon carrying a color TV camera, an ATV transmitter and a crossband voice repeater. The balloon will also carry a Global Positioning Receiver and a packet transmitter that sends lattitude, longitude and altitude in a format that can be used by the APRS packet program to draw a map and plot the balloon's position on it. This will be a standard ASCII packet signal and people without the APRS program can read the balloon's position directly with their regular packet gear. No connects or digipeating through the balloon will be possible.

After the flight, the payload and video tapes of the balloon signals will be displayed at the University of Wisconsin's Engineering Expo, which runs from April 21-23 (the weekend after Easter).

The winds aloft are quite vigorous at this time of the year. Typical wind speeds reach 40 to 100 miles per hour or higher. If the winds are heavy on launch day, we'll try to keep the maximum altitude down to about 50,000 ft to keep the balloon from landing in Lake Michigan. If winds are light, we'll go for 100,000 feet.

Balloon chasers are very much wanted and everybody is invited to join the chase. You don't really need any DF equipment - if you're a hunter with a good pair of boots, you may be worth your weight in gold if the balloon lands in a bad location. People who can climb trees may be just as valuable.

The launch will be announced on the Baraboo 146.88 repeater the morning of April 8th. We expect to do most of the chase-crew co-ordination using the balloon's cross band repeater.

REPly to this message for more information or email me at djmullen@facstaff.wisc.edu

For BARS, Dave, N9LTD

An amazing little box. Absolutely revolutionizes the concept of covert
frequency capture. It's expensive but worth it. I've captured sooooo many
unpublished and unknown frequencies by carrying it around: store security
radios, wireless headsets, local paging transmitters, you name it. Just be
warned: the tiny antenna they push is good only on UHF. It's fairly deaf
on VHF-hi and totally deaf below that. Be prepared with a good selection
of single-band duckies to mix and match.

Hiya Al; I wonder if you could point me in the right direction here. A buddy of mine - a General class ham - is going to Canada at the end of the month via I81 and would like some scanner stuff to listen to on the way. The obvious targets would be NY state police, county fire and possibly some town frequencies as well.
I know that he can carry a mobile scanner since he is a ham but what about Canada? Are there scanner restrictions there? (He is going to Montreal).
He does have an Internet account, so if there is a www page or ftp site he should access for this info, that too would be very useful. Also I see that there is some kind of scanner software (listings??) for PA., and one individual wanted to know if there was something similar for NY. I'd like that info too, if you have it.
Thanks for any help here - I owe you a 6 pack of your favorite tuning oil the next time I see ya, hihi!

The odds are that R.S. will leave the mod alone, or at worst replace the diode.
But if you are nervous, buy a pack of 1N4148(or 1N914)switching diodes, and replace it yourself.
Note, unlike units like the PRO-43, there is NO way that they can make a 2006 unmodifiable, as there is NO version of this scanner with the "total" lockout.
R.S. discontinued the model instead.

>Don't want the Ramsey S/D (SS 70) for any fancy or digital, etc., just
>plain descramble of this "duck-talk". Will I have any luck guys, or will I
>just learn how to assemble a neat little Ramsey kit.

The SS-70 uses speech inversion for scrambling/descrambling. If that's the technique you are hearing, then the SS-70 should descramble it.

I built an SS-70, and it works okay for what it is. I do notice that it injects a signficant amount of white noise into the recovered audio path.

Unless the parts in the kit are defective, the kit should work--it's simple enough. In general, I find that Ramsey kits work if assembled carefully, although they frequently could use some additional optimizing by the kit builder once the primary kit is built. The couple of Ramsey kits I've built (radar gun, FM10A, descrambler) worked once I (carefully) assembled them, but I had to rely on hints from the net and my own construction experience to really wring the best performance from them.

Your frequencies were OK, but the usage should more correctly state:

F-1 860.9375 OPERATIONS - DIVISION 1 (Central/East/West)
F-2 859.9375 OPERATIONS - DIVISION 2 (South/Harbor)
F-3 858.9375 OPERATIONS - Division 3 (San Fernando Valley)
F-4 857.9375 DISPATCH - EMS (South of Mulholland)
F-5 856.9375 FIRE PREVENTION BUREAU
F-6 860.4375 ADMINISTRATION
F-7 859.4375 DISPATCH - FIRE (South of Mulholland))
F-8 858.4375 DISPATCH - FIRE & EMS (San Fernando Valley)
F-9 857.2375 DISPATCH - ALTERNATE
F-10 856.2375 OPERATIONS - EMS (Citywide)
F-11 860.7625 COMMAND
F-12 858.2375 TACTICAL
F-13 857.4375 TACTICAL

F-14 856.4375
TACTICAL

F-15 859.7625
TACTICAL
F-16 858.7625
TACTICAL
F-17 857.7625 TACTICAL
F-18 856.7625 TACTICAL
119.9750 AIR OPERATIONS

I appeciate your interest in the Los Angeles City Fire Department. Please
contact me whenever I can be of assistance.

PUBLIC REPLIES ONLY PLEASE

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA. It
tells where you can buy your first scanner, what features
it should have, where to get it repaired if required, how
to get frequency information, and mentions a few scanner
clubs worth joining.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, armored cars, trains, taxis,
airplanes, and buses are all equipped with radios and you
can listen to them. You can monitor the local sheriff and
fire departments to hear about events "as they happen,"
before the news reporters hear about them. Hostage dramas,
bank robberies, car crashes, chemical spills, tornado
sightings are all fair game. In a single afternoon, you
can hear a high speed police chase, Drug Enforcement agents
on a sting operation, and undercover FBI agents as they
stakeout a suspect.

How about listening to a presidential candidate discuss
strategy with his advisor from a 415 MHz radiophone in Air
Force 1, or a team of G-men protect him while transmitting
in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you
can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots.

Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

You can even listen to the order taker's wireless microphone at the local McDonald's restaurant on 154.6 and 35.02 MHz!

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. A new law outlaws listening to cordless phones, too, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the laws.

It is now illegal for companies to sell recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a 39 page paperback, ANARC Guide to U. S. Monitoring Laws, compiled by Frank Terranella, available for $9.95 + shipping from Grove Enterprises, PO Box 98, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners bear the Realistic label but are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000

have good reputations.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 40 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often poor.

Deluxe scanners can be controlled by a personal computer, although this feature isn't important to many scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are undesireable due to the interference they cause, e.g.,

hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces image reception.

Currently, the more popular scanners include the Uniden/Bearcat BC760XLT (a/k/a 950XLT) and discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, and Radio Shack PRO-43 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The new Uniden replacement models, the BC9000XLT and BC3000XLT, work very well and are my current favorites.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 has recently been replaced by the 1000 channel PRO-2035. The portable Radio Shack PRO-62 is a good performer. All three models employ up conversion and are made for Radio Shack by GRE (General Research Electronics). Both GRE and Uniden make scanners for Radio Shack.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a spring shaped antenna, covered by rubber. Although it is small and tolerant of physical abuse, the range of a heliflex antenna is very limited. Augmenting it with a 19" telescoping metal antenna can improve portable reception greatly.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to lightning strikes because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because it they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Wal-Mart, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200. Telephone (orders only): (800)438-8155.

- National Tower Company, PO Box 15417, Shawnee Mission, KS 66215. Telephone (913)888-8864.

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Marymac Distributing (Katy, TX) sells Radio Shack scanners at discount, but charges a 20% restocking fee for returned merchandise. Telephone (800)231-3680 and (713)392-0747.

- Scanner World (Albany, NY). Telephone (518)436-9606.

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Many ham radio dealers, like Amateur Electronics Supply (Milwaukee, WI, (800)558-0411), also sell scanners.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

If you are handy with a soldering iron, you may be interested in modifying your scanner to add features or enhance its performance. Be warned this usually voids your warranty. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

ftp.cs.buffalo.edu
garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here are least two companies which repair scanners:

1. Electronic Repair Centers (telephone 708-455-5105) - Several people have been pleased with good repair service from Electronic Repair Centers in Franklin Park, Illinois. Although they are not authorized to perform warranty work, this outfit has been repairing Bearcat scanners for several years. They charge a flat rate of fixing scanners, and shipping is extra. Electronic Repair Centers will fix Regency scanners if they can obtain the parts.

2. G & G Communications (telephone 716-768-8151) - This family owned company repairs scanners and stocks parts for several older models. G & G sometimes buys old scanners, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Radio Guide, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A new | 3rd edition is expected in early 1995. Monitor America contains several pages of police, fire, local government,

news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's 168 page Top Secret Registry of US Government Radio Frequencies. | Published by CRB Research, the 8th edition is available | from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and Kneitel's sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. It will likely disappoint experienced scanner hobbyists and is better suited for beginners. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the

US. It works well.

Grove enterprises sells FCC license information on CDROM for $100. The fields are similar to PerCon's Spectrum CDROM, but the transmitter and licensee location are intermixed which makes query results confusing. The first release has problems with mistakes in the data and documentation, and I look forward to a new release to correct these shortcomings.

Over 15% of the FCC licenses, including many fast food restaurants, contain transmitter latitude and longitude but specify no transmitter city. To determine the location of those transmitters requires using the latitude and longitude information.

As I have already done for dozens of radio enthusiasts and companies across the country, I will locate FCC licensed and selected FAA transmitter sites in an area of your choice, and produce a custom report. To make it easy to locate transmitters, the report includes an 8-1/2" by 11" scaled color map marked with transmitter sites and cities (no streets). I call this innovation RadioMap(TM) service.

It allows you to identify antenna sites (including paging and cellular phone cell sites) and visualize the transmitter locations in your neighborhood, near your office, at an airport, and other places of interest -- from VLF through microwave. Industry uses RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites.

This is completely different from, and independent of the Grove Enterprises CDROM.

Ham radio stations are not listed. The RadioMap report includes frequencies, callsigns, and licensee names. For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density. A 5 mile range (100 sq. mi. area) works well in most suburban areas. In rural areas, ranges of up to 10 or more miles (400 sq. mi. area) are possible, while ranges of 1 to 2 miles produce best results in urban cities, e.g., Manhattan and downtown Chicago.

I will produce custom RadioMap reports for areas in any of the 50 states. Send $25.95 (check or money order) for each RadioMap report, your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM central time. *

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio users to identify their operations with their assigned call letters, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good

judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

The world's largest scanner club is the Radio Communications Monitoring Association (RCMA). Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are $24.00 per year, which includes the monthly

RCMA Journal, which consists of approximately 95 pages. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz.

Inquiries about RCMA membership should be sent to RCMA General Manager, P.O. Box 542, Silverado, CA 92676, USA.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

AOSC questions can also be sent electronically to:

rccons!aosc_hq@telerama.pgh.pa.us or
dave.marshall@f240.n108.z1.fidonet.org.
FidoNet: 1:108/240.0

AOSC also has a MEMBERS & EDITORS Scanner related echo, AOSCNet, distributed via FTN on 6 BBS systems, and via Internet Mailing list. For info on the ECHO only, contact:

R.E. Christian, AOSC PA/AOSCNet Founder
PO BOX 12763,
Pittsburgh PA 15241-0763.
FAX: 412-831-5860.

Internet: rccons!aosc_pa@telerama.pgh.pa.us
rccons!aoscnet_hq@telerama.pgh.pa.us
rick.christian@f220.n129.z1.fidonet.org
FidoNet: 1:129/220.0

To receive a file of info on the All Ohio Scanner Club via Internet send to: rccons!ftpmail@telerama.pgh.pa.us

In body: get aoscinfo.zip

This will send a UUENCODED info packet to you. The file contains an outline of the material you will find in the American Scannergram, the AOSCNet, and an application for membership. (Note: This file will not be sent back to *.fidonet.org addresses.)

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, most at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $15 check, payable to Kim Moran, to:

The Command Post
attn. Kim & Ted Moran
6143 W. Touhy Avenue
Chicago, IL 60646

Some CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (708)852-1292.

Here is a tentative meeting schedule for 1995. All meetings will be held on Saturdays at locations announced in advance.

February 18, 1995 - Westmont Police Dept.
April 15
June 17
August 19
October 14
December 16

Bring a notebook and your appetite.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

I am often asked, "How do you find these frequencies?"
Scanner enthusiasts can obtain frequency information from
several sources, including books, government microfiche
records, or other listeners.

Books

The most convenient source of fire and police frequencies
is the Police Call Radio Guide, published each year in 9
regional volumes by Hollins Radio Data, and sold at Radio
Shack and larger book stores for under $10. Police Call is
basically a computer printout of FCC license information in
the fire, police, local government, and conservation
services in two lists: by licensee name within state, and
by frequency. Later editions have included a few pages of
local airport and nonsensitive federal government
frequencies.

I highly recommend Richard Barnett's 1992 book, Monitor
America, published by Scanner Master Corp. A 3rd edition |
is expected soon and will be available from Grove |
Enterprises for about $30. This second edition is crammed
full of police, fire, local government, news media, sports,
national park, and commercial broadcast frequencies for all
50 states. The information was compiled mainly from
members of the world's largest scanning club, the Radio
Communications Monitoring Association (RCMA). Monitor
America contains detailed communications system profiles
and precinct maps for major metropolitan areas. Police and
fire radio codes and unit identifiers unique to local
agencies are listed for several cities. This differs from
Police Call, which gives a more sterile, but uniform

treatment of licensees, listing even the smallest of towns. A 3rd edition is expected in early 1995.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Beyond Police Call, available from several sources including Radio Shack, covers the business, schools, and other stations not covered by Police Call, its sister publication. One volume covers the entire USA, but no call signs are shown.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The second edition is about 400 pages and is available from Official Scanner Guide. The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $100 instead. The fields are similar to PerCon's Spectrum CDROM (see below), but the transmitter and licensee location are intermixed which makes query results confusing. The first release has problems with mistakes in the data and documentation, and I look forward to a new release to correct these shortcomings.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. It works well.

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

Over 15% of the FCC licenses, including many fast food restaurants, contain transmitter latitude and longitude but specify no transmitter city. To determine the location of those transmitters requires using the latitude and longitude information.

As I have already done for dozens of radio enthusiasts and | companies across the country, I will locate FCC licensed | and selected FAA transmitter sites in an area of your choice, and produce a custom report. To make it easy to locate transmitters, the report includes an 8-1/2" by 11" | scaled color map marked with transmitter sites and cities (no streets). I call this innovation RadioMap(TM) service.

It allows you to identify antenna sites (including paging and cellular phone cell sites) and visualize the transmitter locations in your neighborhood, near your office, at an airport, and other places of interest -- from VLF through microwave. Industry uses RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites.

This is completely different from, and independent of the Grove Enterprises CDROM.

Ham radio stations are not listed. The RadioMap report includes frequencies, callsigns, and licensee names. For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density. A 5 mile range (100 sq. mi. area) works well in most suburban areas. In rural areas, ranges of up to 10 or more miles (400 sq. mi. area) are possible, while ranges of 1 to 2 miles produce best results in urban cities, e.g., Manhattan and downtown Chicago.

I will produce custom RadioMap reports for areas in any of the 50 states. Send $25.95 (check or money order) for each | RadioMap report, your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. 708-554-3839 6-10 PM central time. *

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA)1. Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'2.

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage.

Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA).

Founded in 1975, the RCMA is the "first national and international organization of monitor radio listeners." There are several regional chapters which hold regular meetings. Club dues are collected annually, which covers a monthly newsletter, the RCMA Scanner Journal, about 95 pages long. Although the focus is on VHF and UHF ranges, there is coverage of HF utility stations below 30 MHz. A recent liberalization of club policy now permits the printing of most federal law enforcement frequencies, e.g., Secret Service, FBI, Customs, and DEA.

Inquiries about RCMA membership should be sent to:

RCMA General Manager
P.O. Box 542
Silverado, CA 92676
USA

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road

Springfield, OH 45503

Do Your Own Sleuthing

The real challenge is deriving new spectrum usage information. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

More about sleuthing will be discussed in Part II of this article.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?
Part 2: Sleuthing

by Bob Parnass, AJ9S

Part I of this series discussed how scanner enthusiasts can obtain frequency information from books, government microfiche records, or other listeners. This installment discusses digging up new frequencies on your own.

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained

radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping

malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described in Part I of this article, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training

Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993, 1994, 1995 by Bob Parnass, AJ9S |

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. Free distribution is encouraged.]

Introduction

The original Bearcat scanner line was manufactured by
Electra of Cumberland, Indiana. In the mid 1980s, Uniden
bought out the Bearcat scanner line and Uniden's first
Bearcat scanner was the 800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s. Electra stamped all of its scanners with a
manufacturing date code on the rear of the cabinet. The
code is comprised of a single character (C = Cumberland,
Indiana, P = Puerto Rico), followed by four digits denoting
year and week the radio was built. For example, "P8422"
denotes the radio was made in the Puerto Rico factory
during the 22nd week of 1984.

Schematics and Parts Available

Schematic diagrams may be obtained from Uniden/Bearcat's
parts department, (317)842-2483.

G & G Communications (telephone 716-768-8151) is a family
owned company which repairs scanners and stocks parts for
several older models, especially Electra/Bearcat and
Regency brands. They are located at 9247 Glenwood Drive,
LeRoy, NY 14482.

Electronic Repair Centers in Franklin Park, Illinois |
(telephone 708-455-5105) has been repairing Bearcat
scanners for several years. They charge a flat $45 repair
rate for programmable and $30 for crystal scanners, and
shipping is extra. Electronic Repair Centers will fix

Regency scanners if they can obtain the parts.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 scanners I've fixed, C98, a | capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. The

22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

I replaced the 22 uF capacitor in the switching power | supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate | pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two

BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Other Problems

Complaints of low audio output and occasional microphonics | in two Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

I recently saw a Pro-51 scanner for sale for $200. The
seller says that it is cellular modifiable, is this true? Is this a
good scanner, and a good price, or should I wait for a Pro-43? I am new at
scanning and am looking for advice, any of which would be appreciated.

Dan, It's encrypted. You can get A to D and Dto A convertors that aren't
alot of money and build your own decoder. It won't get you anywhere
though because it's also encrypted. Take a look at a Motorola brochure,
if it was just a digital signal not encrypted it would be a piece of cake
to listen. I assure you the feds wouldn't pay that kind of money for the
radios if they weren't encrypted. The encryption scheme can be changed
over the air on some of the newer radios and the older ones are
reprogrammed via the keypad at least once a month. Open any electronics
parts catalog and you can see A-D and D-A convertors are relatively
cheap. The big problem if you were lucky enough to crack the encryption
is it changes and it's against the law to decode it, it's also a Federal law.

Just because you have a Saber doesn't mean it has DVP. DVP is an option
and it's also selectable. You can elect to turn it off or turn it on. The
DVP is an option board not normally installed. Are you sure your radios
have DVP? Was it turned on?

I listened to a McDonalds Freq here in town and heard some pretty funny stuff. Whats really great is driving up to the order window with the car wndow rolled up and opening up the vent window saying your order and than changing it. Meanwhile the kid is wondering how you can hear them. This is a college town so a lot of funny stuff occurs.

Sounds like current police radar to me:-) Woefully inaccurate.

Bad News. Some newer units like the Stalker (Ka) and Golden Bear(?) offer
the option of displaying the fastest signal. The gun has an LCD display
and will display 3 speeds (L to R) and the highest speed on the extreme
right. One unit that I don't know the name of display, only displays the
highest speed. I don't know that that technique would hold up in court
though. There are supposed to be a few more units coming that can "track"
multiple vehicles (but still doesn't tell you what or where they are).
Theres also one that will be able to switch from front to rear at the
flick of a switch and occupy only one antenna housing.

One question though is why are LE agencies switching to Ka? The benefit
used to be it's "stealthness" but every detector sold now has Ka on it
(and usually Laser too). So whats the big deal with it. It's
astronomical price? It's "pretty" display?? To me, X-band seems to be the

best band for the cops. It's:

--Cheap (saves us taxpayers $$$)
--Stealth (Yes, stealth. Think about it when your detector goes off in X band you don't know if it's a cop, door opener, burglar alarm, HAM radio, etc.)
--Since it's cheaper, you can add more features like DSP

If it's K band there are two possiblities:
-Cop
-Greyhound bus

If it's Ka there is only ONE thing
-A cop (And since he has Ka, he'll be trying to pay it off)

Below is information received from a www email server based in
Eire. Unfortunatly it is in html format, but is still
readable. Does anyone have an html to write,works or
wordperfect (5 or 6) convertor?

73

Peter G8YJZ

WebMail

This is a mail-based server to allow networkers who have only
email access to retrieve documents from the web.

To request a document, send an email message to

webmail@www.ucc.ie

containing the command in the text body:

GO url

where url is the Uniform Resource Locator of the
document you wish to retrieve. For example, to retrieve this document,
send the line

GO http://www.ucc.ie/info/net/webmail.html

Only one request per mail is currently dealt with. This server
cannot handle binary files, so requesting a URL containing
``ftp:'' will likely fail as will requests for images like
GIFs. For ftp-by-mail, use ftpmail@decwrl.dec.com. There is
a size limit of 32786 bytes: files larger than this will not be
returned.

The GO command must start in the first character position on
the line, as must the HELP command which returns this document.

Please refer all problems and suggestions to

pflynn@www.ucc.ie (Peter Flynn)

From: jpelura3@illusion.com
Message-ID: <06607FWPDJUIOQGBRCJ@illusion.com>
Source record: 259444

I had the option of buying a Pro-43 or a -39. I chose the -43.

Was this the right decision as far as a modifiable scanner in concerned?
Which one has more mods?

I have a BC XLT 200 also, so the 800 restore on the pro's would not be my
ONLY concern.
As far as the freq. range goes, I know that the -39 has the 108-something
range but it lacks the 220-512 range of the -43.

Are there any other differences between the pross other than the extra $50
bucks for the -43?

I am open for suggestions, still have about 20 days to return the -43 if I
want to <G>.

I picked up a Radio Shack Pro-51 and would like to know if this was a good choice.(I know I should have asked first) It was the last one at this store and the demo model. I think I could return it for another if I wanted to. The reason I got this one is they are on sale with $80.00 off. ($219.00) They did have the older models too. The keyboard mod works on my scanner, a 7A4 with an orange dot on the box. Any thoughts on this would be appreciated.

Two possibilities...

1. Send email to listproc@www0.cern.ch

in the body of the message, put:

www http://www.demon.co.uk/lowe/index.html

this will return to you the document and a list of all
documents referenced in it .

2. Send email to webmail@curia.ucc.ie

in the body of the message, put:

go http://www.demon.co.uk/lowe/index.html

this will probably mail you the same info, but I haven't
tried it.

N.B. These work with any URL
The URL specified is limited to the followng characters:
0-9 a-z A-Z /:._-+@%*()
Only text contained in the web page will be sent to you,
no graphics.

Hope this helps.

Regards,
Julian.

I spent a day in a cop car as part of a "observer" program. We spent the day shooting radar beams into speeding cars.
No surprise there, but as we were parked and looking northbound, The cop looked in his inside rear view mirror and then pointed his radar gun into his outside rear view mirror and grabbed a speed from another north bound car. The cop told me that any error would favor the speeder. I never heard of mirror action. Any comments?

I used to work for a Private Detective firm. One of my jobs involved the detection of a fast food worker who allegedly did one-hits (drugs) in the bathroom during break. I had my scanner tuned in to the wireless and knew when the person went on break. Thank goodness she wasnt doing one-hits, it turned out that someone was mad at her and spread some rumors. Fun time it was though with our "advantage."

Jay

Bruce Hallman (deadfish@netcom.com) wrote:
: Would someone please tell me how to adjust my telescoping "Radio Shack"
: center load antenna for use with my hand held scanner, to optomize
: reception for the different common frequencies?

From the RS document:
25-136 MHz Extend all nine sections
138-174 MHz Extend only top four sections
220-900 MHz Extend only 1 to 3 lower sections

The adjustment is most crucial for transmitting. I normally only use the antenna in two different ways. Below 220 Mhz I extend all sections. Above that freq I only pull all the lower sections out. I find that extending all the sections works better than just the top four in the 138-174 range.

>>>Help! Need a friendly person to supply freq. info for DeCamp Bus
Lines...
>>>I'm a New Yorker who's starting to commute to NJ on a regular basis
(and
>>>never needed to buy Scanner Master's NJ Business Directory till now!).

Almost all the commuter bus lines in New Jersey operate on NJ Transit's
trunked 800 MHz system. It's a statewide system usually in place at the
NJ State Police towers. You'll hear a lot of comms on those channels if
all you want to hear is DeCamp....

Scanner Master has the freqs you need.....(800) SCAN-701.

I've found that for the NOAA weather station (162.400), extending the
entire antenna, then collapsing the first section directly above the
coil works best. Try experimenting with collapsing that section while
listening to 6 meters and NOAA and you'll get a feel for it.

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as

identified in the table below.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver	Res-istor Value	Stock Comments
Radio Shack PRO-24	R35 33K	replace with 220K. Located between pins 12 and 14 of MC3357 (IC1)
Radio Shack PRO-2002	R197 47K	try 220K.
Radio Shack PRO-2004	R148 47K	remove R148 or replace with 220K. On linear board, between pins 12 & 14 of TK10420 (IC2)
Radio Shack PRO-2022	33K	replace 33K with 220K. Between pins 12 & 14 on IC-1 MC3361
Radio Shack PRO-2035	100K	replace 100K

	with 220K.
	Between pins 12 & 14

Perhaps I should clarify this. If that section is collapsed while listening to 6 meters, you'll notice degradation. While listening to NOAA, you'll notice improvement.

Royal Crown is the White House Communications Agency. Sundance is the
Vice President (Al Gore) hence the importance of him getting the call.
Air force 2 is the aircraft I.D. when the V.P. is on board. He flys a 707
and Air Force 1 is a 747....The Presidents' code name is Eagle.....

I am in the same boat! My 2006 has been modified.

Do you use the L/O Review button much? If they see the diode clipped, it will void the original mfg. warranty. The 5-year plan it may not, since you did pay for it.
A salesman told me as long as you don't beat it with a hammer, they will fix it, or replace it.
Since it's not directly related, they probably will fix it under warranty. I hope!

If you take it in, and they fix it, please e-mail me with the results. I would be in the same
boat! Thanks... Daryl

LB> offical State Letterhead and a copy of Michigan Compiled Law Section
LB> 750.508 was included, I'd have to trust what it says and disregard your
LB> opinion. One in the hand beats two in the bush. Sorry...

Les, if you will re-read what I said, you will see that the states cannot
make more restrictive laws if the relative Federal law is pre-emptive. (This
also works for making LESS restrictive laws)
Evidently it's the 'pre-emptive" part that's causing a mis-understanding.
This means that the Federal law is supreme, and lower legislatures can't
make (enforce may be a better word) either stricter or laxer versions of the
same law, depending on the intent of the law. If the Federal law is NOT
pre-emptive (as with firearms laws, for example) this doesn't mean anything.
It gets complicated. ;-)

Here's my growing collection of such fun stuff:

The listing can be read horizontally to see who's on a particular frequency or vertically for some of the major chains to see which frequencies they've used elsewhere.

This list was compiled from numerous posts on the Internet news groups alt.scanner and rec.scanner from many posters, among them:

1. Brad Steinman (cscon0151@uoft02.utoledo.edu, 131.183.1.4),
2. mcneill@salem.enet.dec.com,
3. Bob Parnass (parnass@ihlpm.att.com),
4. stretch1@aol.com.
5. Berton Carson (g9153402@huey.csun.edu)

Thanks for sharing the information!

Warning: unfortunately some of the postings confused CTCSS tone frequencies (in Hz?) with carrier frequencies in MHz, so some of the listings below are unreliable. I've started listing specific references next to frequencies listed. Scan the bands and see what's around locally.

Hope this helps; have fun,
-Patrick Penzias Dirks, pwd@apple.com.

Check 118-136MHz AM....hot air balloons have to be equipped with aircraft
radios, and they fall under the same classification as commercial aircraft.
They tend to use some frequency in the band that isn't in local use to talk to
other balloons and the chase vehicles.

Someday I'm gonna try real hard to get the last screw out (stripped) to do the
extended RX mod to get the aircraft band.....last year I got to ride in one
of the chase vehicles.....

|>Do not buy Millennium. They Suck. The don't last as long as the Radio
|>Shack Rechargables. It's just a big Marketing gimmick. Don't fall for it.
|Seriously? I was gonna get some Milleniums.....

Yep, they SUCK (tm)! They have a rapid self-discharge rate for some strange reason, and their 3-hour charger somehow knows not to work with standard NiCads manufactured by other makers. Yes, even though the "AA"-cells have something like a 700-750 mahr rating, if you charge them up, within a few days (certainly within 2-weeks), they are DEAD!

|How about panasonic? They any good.... or Ray o Vac?

Panasonics, Rat Shacks, Sanyo NiCads seem to perform decently; Digi-Key (1-800-344-4539) sells all sorts of Panasonic Nicads, including the high-capacity "S"-types (P236 - 700mahr for "AA") and the "E"-type 600 mahr "AA" (P155) in both singles and 10 cell pricing...

POP'COMM 5/95 HIGHLIGHTS =

=

"Popular Communications" =

May, 1995, Cover Story =

=

"Maritime Scanning" By Christopher Bleecker, KTX5AM
=A91995 CQ Communications, Inc. =

Ship Ahoy! Spring and summer bring lots of exciting
action to the VHF marine frequencies. And the cover
story of the May issue of "Popular Communications" =

is devoted to "Maritime Scanning." Author Christopher =

Bleecker, KTX5AM, explains the confusing array of VHF
marine channels, where to find what sorts of activity
and how to find commercial, recreational and emergency
service communications.

Also featured in the May "Pop'Comm" are:
-- "Selected English Language Broadcasts," Spring 1995,
by Gerry L. Dexter
-- "Radio: A Look Back," by Alice Brannigan
-- "Scanning AWOS," the VHF weather stations NOAA never
talks about, by Lewis Keseberg, KCA6BK
-- "Shortwave Sits in the Lap of Luxury," a look at the
newest amenity in the Peninsula Hong Kong Hotel,
by Deena Marie Amato, Associate Editor, and
-- "More Central American Adventures," by Dr. Adrian
M. Peterson, N9GWY

The May, 1995, issue of Popular Communications should
be in subscribers' mailboxes and on newsstands by mid-
April.

POPULAR COMMUNICATIONS is the leading magazine on =

all aspects of hobby communications. Regular =

coverage includes monitoring short-wave broadcasts
(also known as "world-band radio"), short-wave =

"utility" stations, scanning VHF and UHF
communications, satellites, broadcast-band DXing, =

CB, emergency communications, amateur (ham) radio
and more. For information, e-mail POPCOMM@aol.com,
CQ@genie.geis.com or 72127.745@compuserve.com.

4139. Clinton Visit/Secret Service/Atlanta

Newsgroup: rec.radio.scanner

From: not.available@uunet.uu.net
Message-ID: <3lbpq1$9qr@moe.cc.emory.edu>
Source record: 259231

Today (Wed. Mar 29), the Secret Service is in Atlanta for President Clinton's visit. Does anyone know what frequencies the Secret Service uses in the field? I don't have ready access to Tom Kneitel's Top Secret Registry of US Government Radio Frequencies, so I regret that I can't look it up myself?

If you don't know the specific frequencies, do you know what general areas I should scan through?

Any help would be greatly appreciated! Also, is there any reason (legal or otherwise) why someone couldn't scan those frequencies?

Thanks!
Gilligan

Hello, I have a question, where I live i Ontario, it is illegal to have a radar dectector, but I was wondering, in Canada, it is legal to monitor ANY radio transmissions, i wonder how the law can say that it is illegal to monitor radar warning devices. I wonder ifyou made a case that looked like something like a scanner, etc... and put the radar dectector in it, and said that it was a radio, or whatever.
Any reply would be appriciared!

Subject: Re: case for handheld

Here's the FINEST case available for the PRO-43, PRO-39, and
PRO-44 handheld scanners. Sine I received mine last year, it has
NEVER come off my PRO-43.

I have NO "piece of this action" - this post is for the benefit of
scanner enthusiasts ONLY. This case is a worthwhile investment. It
protects the units from damage. It is fully-functional. It is made BY a
scanner enthusiast FOR scanner enthusiasts. And the dealer, Howard
Bornstein, is a class individual.

---

 wcECHO 4.0 AR-Net: ATTENTION to Details Mira Loma, CA 909-681-6221

FROM: Howard Bornstein
Design EQ
P.O. Box 1245
Menlo Park, CA 94025

I now have limited supplies of custom-designed, hand-made
leather cases for the Radio Shack PRO-39, PRO-43, and
PRO-44 handheld scanners.

The case is handmade out of fine, black, Corinthian leather
(ok, I'm kidding about the Corinthian part) and fits snugly
on the PRO-39/43/44. The case has cutouts for the display,
the keyboard, and the power ports. It also has sound
holes over the speaker.

The scanner slips into the case without having to put the
belt clip through a slot. The case is designed to stay on
the scanner all the time, so, to that end, there is a
velcroed flap at the bottom that allows you to open the
battery compartment and change the batteries without ever
having to take the case off. There are also slots in the
back of the case if you want to loop your belt through it
for greater security.

With a little "training" the scanner in the case will stand up
on end without any problem.

The cost of the case is $29.95 plus $2.00 S&H. If you're in
California, you'll need to add $2.47 state sales tax (sorry).
Since the cases are handmade, it may take as long as 3-4 weeks
from receipt of your check or money order. I will try to speed
this up as much as I can. The cases are sent out via airmail

and satisfaction is guaranteed.

To order, send a check or money order to:

Howard Bornstein
Design EQ
P.O. Box 1245
Menlo Park, CA 94025

You can reach me by phone at 415-328-9181 afternoons PST or via CompuServe Email (ID:76174,637.) If you are ordering from outside the US, please drop me email, because the postage will be a bit more. Feel free to contact me if you have other questions about the case, and thanks very much for your interest.

Regards,
Howard

4149. cell restore on bc890xlt

>>article on how to restore the cellular on it, but I lost the article
>>in the move to Toronto (I am student and live downtown).

The mod is a simple one, involving onle the removal and re-placement of
a single surface-mount diode.

The mod is available on ATTENTION to Details BBS at 909-681-6221 FREE to
first-time callers. All you have to do is download their User Service
Agreement (a whopping 8K ZIP archive) and then Upgrade your own security
from their Main Menu. Then search the files for "890" or look in the
Bearcat/Uniden Mods File Area.

4150. Pro 37 mods 1/4

Newsgroup: rec.radio.scanner
Date: 1995-03-29 00:00:00 UTC
From: clint.bradford@woodybbs.com
Message-ID: <93.5248.7592.0NFB9BA0@woodybbs.com>
Source record: 259279

Subject: Pro 37 mods

>>I am begging, PLEADING for Pro 37 mods. I know about the cell phone
>>mod, but are there others?

There are several modifications for about ANY scanner. What would you like yours to do that it doesn't do now? S-Meter? Audio improvement? Here's what I could quickly find on ATTENTION to Details BBS at 909-681-6221:

[NOTE: Don't perform these mods. You will probably have no valid warranty if performed. These mods might not work. This is offered as information only.]

The PRO-37 uses a diode array to tell its microprocessor what model it is, and thus which frequency bands to allow and what channel spacing to use. European and Australian models have full 800 MHz coverage (at an unknown channel spacing) and a VHF-Mid band (68-88 MHz) rather than a VHF-Low band (30-54 MHz).

The Canadian and US models differ in the amount of care taken to reduce EMI. The Canadian model has additional screening, and one or two other minor component additions to achieve this. Therefore, if you have the choice, the Canadian model is preferable to the US model.

Changing from VHF-Low to VHF-Mid band coverage requires many component value changes (and realignment of the appropriate RF stage). Given that the PRO-37 uses SMT technology, it's not worth trying. (You can change the diode array easily enough, but just don't expect reasonable performance!)

The only sensible (straightforward) modification is the restoration of full 800 MHz coverage on Canadian and US models. The ranges restored appear with a 30kHz channel spacing - which just happens to coincide with the N. American cellular telephone channel spacing. A remarkable coincidence.

The modification described is therefore applicable ONLY to Canadian and US models. (European and Australian readers could always remove 800 MHz coverage if they wished:-).

You will need:

Soldering iron - with a fine point. (The components desoldered and soldered are not SMT, but ....)
Desoldering tool - to remove excess solder
Philips screwdriver - if it fits the screws on the back of the

case it's the right size.
Small pliers - bending component leads while unsoldering
and removing hexagonal posts
Earthing wrist strap - strongly advisable with CMOS components.
(Static can cause premature, if not immediate
failure of components). Wear this at all
times.
Small screwdriver - for prying components etc.

Experience and confidence in working with modern electronics

A couple of hours without interruptions...

Instructions
----
0. READ THROUGH ALL OF THESE INSTRUCTIONS BEFORE STARTING!
1. Remove the battery
2. Remove the antenna
3. Pull to remove squelch and volume knobs
4. Unscrew the 4 screw on the back of the case
5. Separate the case beginning at the battery end and work over the circuit
board and knobs at the top
6. Unsolder both connections to the antenna - ground can be bent away and the
centre has a link to the board
7. Unsolder the two power switch links at the board end
8. Unsolder the ground connections to the metal shield
9. Disconnect the two connectors to the squelch and volume controls
10.Remove 4 hexagonal posts
11.The top board may now be removed by separating it gently from the
connector on the adjacent board
12.Remove 3 screws holding the shield in place
13.Lift the shield to separate it from the lower control circuit board
14.Identify diodes D12,D13 on the control board
15.EITHER cut the diode D13 and SKIP to reassembly OR continue to desolder diod
16.Remove last two screws and remove control board. Take care not to
dislocate the KEY LOCK switch when doing this.
17.Unsolder screening from side of control board near diode array,
and bend back out of way.
18.Unsolder and remove diode D13. Keep it somewhere so that you can replace
it if required to do so by US legislation.

Reassembly is the reverse of the above procedure.

If you performed steps 16-18 CHECK REALLY CAREFULLY that the metal part of
the KEY LOCK switch is in the right location. (Otherwise, you may find
yourself having to disassemble the whole thing again - I know, I did!)

NOTES.

(Continued to next message)

4151. Pro 37 mods 2/4

Newsgroup: rec.radio.scanner
Date: 1995-03-29 00:00:00 UTC
From: clint.bradford@woodybbs.com
Message-ID: <93.5249.7592.0NFB9BA1@woodybbs.com>
Source record: 259280

Subject: Pro 37 mods

(Continued from previous message)

1. One must exercise great caution in the procedure. Check that no flakes of solder get dropped on the boards. Take anti-static precautions by doing the work on a mat and wearing a wrist strap. Do not make any adjustments to the upper analogue board or bend any of the other wire links on it, which are tuned circuits.

2. Another caution is that doing any of the work will probably violate any warranty you may have on the scanner. Might be worth burning the scanner in for ~150 hrs before attempting this to reduce the risk of a latent component fault appearing after you have made the modification.

3. YOU PERFORM THE ABOVE PROCEDURE ENTIRELY AT YOUR OWN RISK. You may wish to obtain a copy of the PRO-37 Service Manual from Radio Shack before attempting this. (Cost about $20 - well written - just wish I could afford all the service gear required!)

4. If you happen to find out what adding D14 does (another difference between N. American and European/Australian versions), I'd be interested to know. It's not mentioned in the service manual. I think it could affect 800 MHz channel spacing - any info on the European Australian PRO-37 specs in this area would be appreciated.

5. If you found something wrong in the above instructions, let me know and I will try and post an update.

6. If you found all this helpful, help someone else and donate $5.00 *today* to your favourite charity.

Share and Enjoy!

PRO-37

This works. I have used this procedure to modify my pro37. One note: there is no reason the remove the logic board. If you have skinny wire cutters, you can easily get to the correct diode. This will save you the trouble of getting the key pad and key lock back together properly.

Restoring the full 800Mhz coverage of the RS Pro-37 scanner.

The following notes have been shamelessly plagiarized from Mark Miller's excellent instructions on modifying the Pro-34. The two scanners are physically so similar that I needed to make only a few minor changes in Mark's notes to make them fit the Pro-37.

• wcECHO 4.0 • AR-Net: ATTENTION to Details • Mira Loma, CA • 909-681-6221

The instructions below are for those that don't like to completely
dissassemble every new electronic toy they buy just to see how it
works. Nor is it for the guy that has been building their own equipment
since the days of the first tube diode. This set of instructions assumes
a moderate level of skill with a soldering iron, and some simple hand
tools. It is aimed at those who just want the additional coverage from
the mods but havn't been building kits for a decade.
lets just call these ....

"NOVICE NOTES" FOR PRO-37 MODIFICATIONS
1. Remove the 4 small phillips screws on the back of the unit
2. Remove the battery cover and battery holder from the case. You won't
loose your programming as long as you don't take all day to do
this.
3. Remove the two knobs on the top of the case (Volume & Squelch)
4. The case snaps together at the bottom via two molded "hooks"
in the back half of the case which fit into two indentations
in the front half. These can be snapped apart by applying
the right leverage to bend the hooks away from the indentations
that they fit into while pulling the case apart. You'll see what
I mean when you look at it. You need to be a bit careful in
forcing the two halves of the case shell apart. Once you have
the snaps at the bottom released, angle up the bottom of the case
until the battery separation wall is clear of the internal metal
frame, and slide towards the top of the unit. Place the back half
of the shell aside.
5. Now you will see the RF board mounted to the metal support frame. The
BNC (antenna) conector leads and the volume control power switch leads
are soldered directly to the board. Carefully desolder these 4 connections.
7. There will be a wire from the volume control knob to the PC board that
is plugged in. Remove the plug from the RF board (needle nose pliers work)
8. There will also be a similar wire (small shielded) from the squelch contro
to the RF board wich is also plugged in. Remove the plug from the RF board.
(Again Needle Nose Pliers work good here)
9. Remove the 4 threaded hex stand-offs from the RF Board (these hold the RF
board to the internal metal frame AND are where the screws that hold the
back of the case screw in) Use a nut driver or Needle Nose Pliers.
10. Now the RF board is mostly free. The only thing holding it in is
the row of connector pins on its botom side that plug into the logic
board. You will need to pry this board up gently. Be warned that
the bottom side of the RF board is just chock full of Very Small
surface mounted components. So use something non-metalic and smooth
to do the prying with.
11. Set the RF board aside.
12. The Internal Metal support frame is now exposed. there are 3 small phillips
screws holding the metal frame to the bottom Logic board (actually, these

(Continued to next message)

4152. Pro 37 mods 3/4

Newsgroup: rec.radio.scanner
Date: 1995-03-29 00:00:00 UTC
From: clint.bradford@woodybbs.com
Message-ID: <93.5250.7592.0NFB9BA2@woodybbs.com>
Source record: 259281

Subject: Pro 37 mods

(Continued from previous message)

screws go through the logic board and into the front half of the case)
2 of the screws are near the top, and 1 is at the bottom of the metal frame
Remove these 3 screws.
13. There is a small socketed wire that leads from the small power pc board
on the metal frame that goes under it and is plugged into the Logic
board. Lift the metal frame up and remove the power plug from the
PC board. Place the metal frame with the rest of your parts pile.
14. You have the component side of the Logic board exposed now. There are
2 small phillips screws at the bottom of the PC board (where the Battery
compartment WAS) Remove them.
15. Once you have the the last 2 screws removed the Logic board is free. The
speaker wires lead from the speaker to the logic board on the bottom side.
These are soldered in but there is enough play in them to allow you to
make the mods.
16. NOTE: The keyboard lock switch is a funky little piece of plastic with
a sliding stainless metal contactor that is just wedged in between the
front case and the logic board. Remove both the switch contacts and the
plastic switch. (best know it now or loose them in the carpet)
ALSO: don't touch the innards of the keyboard itself, which will now be
exposed. It appears that the keys make direct contact with pads on the
circuit board, and you don't want grit and skin oil to be getting in there.
17. On the component side of the PC board you will see lots of nifty surface
mounted components, a box-like capacitor (used for maintaining the
channel freqs while you change the batteries.. and make modifications :)
near the edge of the PC board you will see a couple of small diodes mounted
vertically. These will be labeled on the PC board as D12 and D13. You will
also see places for two other diodes to be soldered in (labeled D11 and
D14) but nothing is installed in these.
18. Now carefully clip the lead coming from D13 and bend the
diode away slightly to make a gap between the resulting two pieces
of wire. Clip it near the middle to leave plenty of room to resolder,
in case you ever want to undo the mod.

You have completed the mod for complete 800mhz band coverage.

Follow the same steps backwards (18->1)and replace "remove" with "replace"
and "desolder" with "solder"

N.B. These instructions are from last night, All the steps are in correct order
as well as the general information. The diagrams are from memory so components
may not be in the exact location indicated, but they will be very close.

LASTLY, Now that you have made the mods, you can use the warranty card to
light the Bar-B-Q Grill with.

DIAGRAMS

Message-ID: <49373.nstn2539@fox.nstn.ca>
Source record: 259287

I wouldn't be too worried about missing out on the UHF aircraft band(about 200MHz to 350MHz). I have been in ATC for a few years now, and most military aircraft have and use VHF. The only things you may miss are fighters' sides of conversations with ATC and most conversations between military aircraft in flight. Most ATC units transmit on VHF and UHF simultaneously so at least for that side of things, you might be able to determine what's being said by the fighter by what the ATC is saying. You will likely miss some good stuff for now, but just keep looking for a used scanner that has these bands. Maybe you'll get lucky. :)

He is probably referring to the fact that the Doppler shift
for an approaching target is different than that for a target
moving away. Since police radar relies on this Doppler
effect, the speed of an approaching vehicle would appear
higher than the same vehicle at the same speed moving away;
in this case, the error would favor the driver moving away.
The mirror itself has no effect on the speed reading.

Source record: 259294

The Scout is the latest advance in hand held frecuency counters. Itexcels
at finding and recording frequencies for security, law enforcement, and
recreational monitoring applications.
The Scout is not a frequencycounter in the traditional sense because it
is not intended to be a measurement tool. Design to work with an antenna
to pick up transmitted frequencies, it is actually a frequency
recorder.Up to 400 unique frequencies can be stored in memoriy, along with
up to 255 hits on each frequenciy. The recorded frequencies can be played
back on the LCD display or data linked to a computer or CI-V equipped
communications receiver.
For discreet recording, The Scout is small enough to fit in the pocket.
Apager-style vibrator is built in to let the operator know when
frequencies are recorded during a walk-by. And others very cool features...
asking for a never used one , $470 USA dollars.

somos lo que somos, o somos los que estamos, si no somos los que somos,
para que somos los que estamos?

Yes and no. You'll find both mil and commercial flights on UHF/VHF. If you program in a 3 state wide area, or are fortunate to live near a training area, you'll have plenty to listen to.

Get a military aviation freq directory, and plug in the freqs in a wide area. I have over 200 programmed into my 2006 and I remote tape everything. I get 1 hours worth of non-stop mil action (per day), some dogfights, some live weapons testing (dive bombing, Maverick IR missles tests, etc) and some air-air refuel, and a lot of typical mil air traffic (check-ins with control towers, etc). That one hour of tape has no pauses, I use a no pause setting on my Nitelogger VOX adapter. If you just leave the scanner on at night at home you'll be disappointed, most of the activity seems to happen during the day. Here, at the Aberdeen Proving Grounds, Maryland, I get plenty of night traing missions since the A10's have night mission capabilities. Taping the activity while away nets the best results.

BTW, most the the national guard activity here (the A10's) are in the 30 - 40 Mhz band.

If you have a standard scanner (w/o mil air uhf) get the Mil Aviation directory and see if you get any nat'l guard activity on the low-vhf side. If you get the 'bug' like I did, get a uhf-mil-air capable scanner. You'll have tons to listen to.

Andy

On 28 Mar 95 02:15pm, PIGMAN POWELL wrote to ALL:

PP> I spent a day in a cop car as part of a "observer" program. We spent
PP> the day s hooting radar beams into speeding cars.
PP> No surprise there, but as we were parked and looking northbound, The cop
PP> looked in his inside rear view mirror and then pointed his radar gun
PP> into his outside rear view mirror and grabbed a speed from another
PP> north bound car. The cop told me that any error would favor the
PP> speeder. I never heard of mirror action. Any comments?

Since a mirror is an optical device, and not an RF device, this is not a good practice, and cannot be condoned by the manufacturer of the radar unit. If *I* were given a ticket based on this type of speed measuring, and I knew it, chances are very good that I would not only get off, but the officer would probably be reprimanded for not following proper procedures.
The best way to use a radar gun is to aim it directly at the target vehicle from an angle of no more than ~15 degrees off the fore-aft axis of the target vehicle, with the transmitter being stationary. Non-target vehicles should NOT be in the transmitted radar beam, as the radar does not know which target the operator has in mind, and will return a reading from what it considers the BEST target, not necessarily the fastest. The more moving targets the radar gun sees, the less reliable is any reading it gives. Many police officers will argue this, saying that their ticket is good, but it just ain't so, and the sylabus that accompanies the radar units, to be used in officer training, point this out.
An interesting aside: I've listened on my scanner to radar units telling other units down the road which vehicles to pull over, and the speed to use on the citation. Since my last traffic ticket (over 18 years ago!) said that the signing officer had observed the infraction, I wondered how these guys were doing this! Turns out that modern citations only say that the signing officer has reason to believe that the infraction occurred! (There! Got this on subject!)

Here in Houston HPD Special Op's are testing the new laser system. Mounted in the rear of a Z-28 they just pull into a parking lot sight the laser in at grill level and start writting tickets. They caught so many the other day they had one unit firing the laser and two units writting tickets as fast as they could, they had quite a impressive line forming when I left the location. One of the units told me "If we get you with the laser, it's your ass in court"

Concerning UHF 200MHz - 350MHz - you are right. ATC does normally broadcast over VHF and UHF simultaneously so I'm not missing out on that. What I do want to hear are the Air Refueling frequencies, the Command Post frequency and a few other ones used here on the AF base on which I live. Also - the local policy here is to use UHF when talking to Ground Control, Tower, Departure, Approach, etc. as much as possible instead of VHF. It gets old only hearing one part of the conversation

Message-ID: <3lck7a$9dj@bubbla.uri.edu>
Source record: 259312

I just bought a Radio Shack PRO-51 and I tried the keyboard mod but it did not seem to work. It did give me access to some test frequencies but none of them were in the 888Mhz range. Have newer versions been modified so that the mod no longer works and if so what can I do? Secondly I have been able to pick up what appear to be cellular calls in the 900 mhz band. There is constant traffic here in my area (Rhode Island) on freqs like 903.750, 905.012, 911.550. Are these cellular calls or if not what are they? Lastly I know this is a FAQ but what are the freqs used by _cordless_ phones. Thanks for your help in advance!

4184. Need help w/ AR8000

Newsgroup: rec.radio.scanner
Date: 1995-03-29 00:00:00 UTC
From: seguine@sirius.com
Message-ID: <seguine-2903951346490001@slip135.sirius.com>
Source record: 259313

I just got the service manuual for my AR8000. I want to hook up a tone decoder, probably the opto one. For best results you need to go into the "discriminator point" - whatever that is. So here is what I found:

"2.6 AF circuit. U6 is AF selector and switched signal passes throuugh U5A H.P.F then amplified in U4 for speaker drive. U5A cuts less than 400Hz unwanted signal like CTCSS tone. (Ah-HA!!) Q15,Q19 work as audio mute switch and U5B is AF amplifier for AF SCAN."

Now what? Can this U5A just be disabled so it doesnt do a low freq cut? Then I wouln't need an extra connection just take the normal audio out, right? and it shouldn't be a problem hearing this 400Hz junk since its subaudible anyway right?
Help.

thanks

Has anyone ever had a problem with the Service Dept. at EEB?

I sent my AOR AR1000XLT to them for warranty service via FedEx on March 14th. The AC adapter, DC plug, antenna, case, strap, and batteries were included along with a cover letter itemizing the contents and a copy of the bill of sale.

The repaired unit was returned today via FedEx per my instructions. Regrettably, the antenna, strap, AC Adapter and DC Power plug were missing. I immediately phoned EEB to report the discrepency. They claimed that they never received these items. Yet, their own packing list includes them.

I shipped the package via FedEx myself after wrapping the unit in bubble wrap, protecting that with foam, using a double wall cardboard carton, and sealing it with duct tape. The accessory items were in the same carton but separate from the AR1000XLT.

I've filed a loss claim with FedEx and hope they'll get together with EEB and work something out. It's not plausible that I'd scam them over < $50.00 worth of accessories when there is a $400.00 scanner in the box.

The people at EEB are courteous and cooperative, as are the customer service representatives at FedEx. I'm confident that everything will turn out all right. I just want to know if this has only happened to me.

I was just wondering if I have been the only person that has been treated poorly by Uniden. I purchased a BC 8500XLT and had problems with it, the same problems as reported by almost every 8500XLT owner. I contacted Uniden and they suggested that I send the unit to them for repair/update (?). When I got the unit back it made more noise than it did before I sent them the scanner (that annoying squelch tail noise). I then wrote them a letter explaining all the problems that I had with the scanner and the "repair". After 2 months I had no reply and then called their customer support line. I was told that they have a policy of quickly responding to such letters. I was then given a specific person to address the letter to. I sent out another letter and now, 2 months later, I still have not heard anything. I have sold my 8500xlt and would like to look at the new Uniden handheld 3000 but with this treatment I think I will save my money for an AOR 8000. Is Uniden this crapy to all of its customers, and if so, I think people should be warned to stay away untill they change their attitude!?

David

Zeet:

I tried to erase my memory on purpose by taking the battery off for 3 weeks. Still kept its memory. Now I know (via this newsgroup) that all had to do was push 2, 9, and manual at the same time and then power up to erase. But at the time I didn't know that. Anyway, it's almost impossible to erase with just a bad battery.

Well folks, the response has been small, but steady. Just a reminder to any of you who may have missed it, I've put a simple, but well organized Web page up at http://www.okc.com/freq-out/

The only thing in it is frequencies for USA and Canada. No mod files, no extra chatter, just organized lists of frequencies by service, state, city and so on.

I'm in New York City (Boy that Fulton Market fire was a real major scanning opportunity) so most of the freqs are for the New York Area. People have been real good in freqs from Canada, Kansas City, Florida and elsewhere. I'll keep putting stuff on if you all keep sending it to freqs@okc.com

Hello,

Yes this is probaly a repeat but I have been reading the news
group but haven't found a good list. I need to know what type of scanner
is the best for the price range of up to $450.00. I have currently owned
a pro-62 and was very dissatified with it. I am currently looking at
getting a unided sportscanner 150 or a bearcat 200xlt.

Thanks,
Harvey Fagler Jr (Tony)

>
>anyone know how to read info like this if you don't have http access???
>How do I do it with email, or is it not possible?

Well, there are a few telnet / hypertext gateways available, though I would
think all these would be text only (ie you can't see any images or hear
any sounds etc included in the pages), but try this:

telnet to 'rsl.ox.ac.uk', and log in as 'lynx', as the connection message
invites. (There's no password needed).
You are them effectively using the lynx software, which is a
text only hypertext browser. To open a specific URL (page), press the
'g' key, and give the location of the page, for example:
http://www.demon.co.uk/lowe/index.html

Better still, install lynx or mosaic or netscape on your system...

Hope this helps,

Paul.

Message-ID: <91c_9503292011@tor250.org>
Source record: 259468

Hi ya.

As you stated from experience....

-> I listened to a McDonalds Freq here in town and heard some pretty
-> funny stuff. Whats really great is driving up to the order window
-> with the car wndow rolled up and opening up the vent window saying
-> your order and than changing it. Meanwhile the kid is wondering how
-> you can hear them.

What a lot of them don't know, or seem to remember, is that once
the order is taken, or even before it is, their mic on the transmitter
pack is always "hot" (ever see the battery belts on those things?) and
even though it's a low power transmitter, they are sending that stuff
out over the air. I've only heard a few window-servers ever shut
off the mic.

I've heard many a swear-fest and ideas on what to do the food as
the employees hate their jobs, the customers and manager as picked up on
my scanner at the local Mc D's/Burger King/Taco Bell and Wendy's.

I know that if I were a manager at one of those places, I'd
definately own a scanner for sure, but that opens up a whole new can of
worms, now doesn't it?

Type to you later,

Vaughan Huska

I like jamming the HR-12 with a sig gen. It's real fun! The cops turn it on....Then turn it off......Then turn it on.......Then turn it off......Then turn it on...I especially like the RCA dog look they give you. Too bad the military won't let me keep it.
The best is when the officer comes up and says "Any idea how fast you were going???" After you say no it's really funny when he says "Are you sure, because I was using radar. Last chance." I had an officer say he was going to confiscate the "yellow box". Yeah, sure.

Any one with access to a sig gen give it a try. It's even better with a scanner so you can listen to him bitch and whine to control.
"Would you like some cheese with that whine!!!"

I bought the PRO-51 and love it. The only thing I wish I had were the
frequencies in the 200-300 range so I could hear some more of the military
frequencies. I knew that the PRO-51 didn't have these freqs but at the
time I couldn't justify the extra cost to get one that did.

4217. "old" RS Police Call

Newsgroup: rec.radio.scanner
Date: 1995-03-29 04:44:23 UTC
From: wa5iyx@n8naa.sat.tx.us
Message-ID: <ockP3c1w165w@n8naa.sat.tx.us>
Source record: 259453

Anyone with old Radio Shack Police Call directories they'd be willing
to part with? I am mostly interested in Vols. 1, 2, and 9 (as my most
recent of those are 1981 vintage!) I mainly just need the 30-50 MHz
listings for use in identifying the F2-skip signals from those
regions (lots of "new" 4-letter/3-number calls). With the
sunspot minimum again approaching there'll be less of that though.

E-mail replies OK.

73, Pat

I thought that the 400 memory Scout was called the Scout 40(?). If not, then what's the difference between the two?

From: maverick@csulb.edu
Message-ID: <3lavpv$2sq@garuda.csulb.edu>
Source record: 259459

Hi, I'll be attending the NCAA Final Four in Seattle and was wondering whether anyone knows of any interesting frequencies I can tune to? Such as:

1) Kingdome security
2) NCAA Tournament Committee
3) Seattle police
4) Seattle fire
5) Downtown hotels etc.
6) CBS sports operations
7) UCLA/Oklahoma St./Arkansas/Univ N. Carolina athletic departments

I am not from Seattle and am having trouble locating these frequencies. Thank you very much for the help. Please feel free to email me directly if you wish.

Sincerely,

Hiran

RC is a specific function/location/etc. of WHCA. Les is wrong about
the aircraft types. There are a bunch of different aircraft that could
be used as AF1 or AF2, depending on mission requirements.

By the way, the modem stuff you heard on that circuit was an
attempt to use a STU-III secure telephone instrument over the RF link.

>
> Pigman

Yeah, I have a comment to that. It's not admissible in court due to the fact that the radar manufacturers specifically state in the user manual of the doppler radar device that signals recieved from objects that have been reflected or refracted off of any reflective material may be inaccurate and will most of the time not achive a reading on the radar at all. If you use use common sense and think about it, though, the radar is picking up the time that it takes to hit the mirror, bounce off, hit the target, bounce off, hit the mirror again, and then the feedhorn of the radar instead of just a straight shot from the feedhorn of the radar to the target and back.

The reason that I say this is because I myself am a police officer and have gotten my ass burned in a court of law when this citizen one day decided that he was smarter than I was when it comes to radar cause he saw me bounce it off the passengers side rear-view mirror when I got him. Needless to say the judge let him off the hook, and a memo was issued to all officers NOT to be "rear-view clockin'" And I no longer do.

From: an187049@anon.penet.fi
Message-ID: <3lf31m$ss7@ux1.lmu.edu>
Source record: 259078

these are the freqs. that i have for the Secret Service:

167.025 "November" White House advance team
166.5125 "Sierra" presidential protection

others are:

165.7875
165.375
165.2125
164.8875
164.400
166.700
164.650
166.4625
162.6875
171.2875

i guess you could scan the freq's from 164-172.

Sj> "ECPA1986"? - I just can't remember when, where and how to enter the
Sj> code in the software.

Sj> Any comments appreciated.

Sj> Steve P

Here is the mod which was in the Feb.1995 issue of MT and my friend, Kevin O'Rourke here in Wheaton...

With the MR 8100 connected to an appropriate computer, insert the software into the drive so that the screen appears as in Figure 1 of your programming guide. With NUM LOCK and CAPS LOCK both turned off, press CTRL+ALT+P; the display will now read, "ENTER CODE".

Press CAPS LOCK, then enter "ECPA1986"; the display will now read, "ENTER CODE:ENABLED", which will then diappear, thus restoring full 800 Mhz coverage. Remember that this procedure will enable certain portions of the 800 Mhz band that is against federal U.S. law.

Enjoy...Jerry

Signal Generator. A VERY important, and expensive piece of test equipment
for ESM/ECM gear (and other things). Ours was about $85K. There are
cheaper ones though.

>in this case, the error would favor the driver moving away.
>The mirror itself has no effect on the speed reading.
>
>George

Am I understanding you correctly? Example: Stationary unit, oncoming
car moving at 50 MPH, reflected signal mixed with transmitted signal,
the difference converted to speed, roughtly 70 Hz / MPH, speed displayed is
50. Now, another car, this one moving away from unit, reflected signal
mixed with source, difference not the same with the first car? What is the
error? Is it predictable? The only predictable error I know of, which does
always favor the target, is the one induced by the angle between the direction
of travel of the target and the direction of travel of the transmitted and
reflected signal. The speed displayed will always be the result of the
actual speed multiplied by the cosine of this angle.

Many times I have pointed unit at oncoming vehicle, noted speed, then when
vehicle was moving away, pointed unit out back window, and read same speed
(both speeds meaning when target was sufficiently distanced such that the
angle was nearly zero and speed displayed was relatively constant).

What is the ratio of the error you referred to between oncoming outgoing
targets?

4253. CB Frequencies.

Newsgroup: rec.radio.scanner
Date: 1995-03-30 00:00:00 UTC
From: nstn2539@fox.nstn.ca
Message-ID: <52124.nstn2539@fox.nstn.ca>
Source record: 259260

Most scanners will scan frequency ranges in their default modes(AM, NFM, WFM). Most of them are in NFM or WFM, but for example, 108 - 136MHz is the aircraft band and it will default to AM.
For CB frequencies, look between 26.965 and 27.405 MHz. Your scanner will automatically select AM mode to receive these frequencies, if it can scan that low. E-mail me if you want a list of CB freq.'s. I have a list.

I thought I thaw puddy tad. Yes, I did hear Boston EMS on 453.XXX MHz simulcasting once. I did not write down the frequency because I did not think of it much. I never understood why Boston has so much priviledge using CMED channel for their own dispatch use anyway. Then again too bad if they leave CMED-10. Hope they bring the repeater with them. That is one of the best signal in Eastern Mass. I can hear them all the way up to New Hampshire.

>code sticker of 7A4 with an orange sticker on the box. I can not get
>800Mhz to program in on channel 23 after trying the above mod. Why is
>this important?

I just purchased a Pro-51 two weeks ago. When the salesman at Radio-Shack
pulled up the information on it to see if he had one in stock, there was a
big line across the top of the screen reading something to the effect of
"Don't sell this if there isn't a little orange sticker next to the barcode
on the box."

I asked him what the orange sticker was for, and all he would tell me was
that it was for a "recent modification" on the Pro-51. Probably means they
fixed that 800Mhz bug then... Oh well...

> just ain't so, and the sylabus that accompanies the radar units, to be used
> in officer training, point this out.

This is very interesting. Try to tell a police officer that he/she cannot
use radar on a road with traffic on it. 15 deg is quite a bit
considering most of the beam is pointed down the road. The fact is police
radar was designed to be used with ONE car in the field of view, a 1v1
encounter. Buuut, how common is it for police to use their radar in
medium to heavy traffic, especially in the moving mode? Very. But, courts
rarely care about that, even if the officer says there was traffic. To
get out of a radar based ticket you have to be very lucky, they want
their $$$.

> An interesting aside: I've listened on my scanner to radar units telling

> the signing officer had observed the infraction, I wondered how these guys
> were doing this! Turns out that modern citations only say that the signing
> officer has reason to believe that the infraction occurred! (There! Got this
> on subject!)

Couldn't you go to court and ask the officer? If only the officer who
wrote the ticket is there couldn't you get off? If the other officer
isn't there, how can you challenge the validity of the radar reading?
Well, the above is a very good reason to carry a scanner. Most police
aren't too pleased with the idea of you having a scanner, so, keep it out

of sight should you be pulled over.

I dunno about him but the freq I was monitoring (170.85MHz) is a repeater output freq. All the police in the whole country is supposed to be linked up together. Maybe the tx from the handheld to the repeater is analog. Is it possible? Just a few days ago when the prime minister was giving some speech somewhere, I could hear the police on analog on a different freq. Could the have used different transceivers, or did they go direct? Are the Sabers digital or a combination of both?

From: rdesjar@mbnet.mb.ca
Message-ID: <3lf67q$1ms@canopus.cc.umanitoba.ca>
Source record: 259270

Last fall, there was some great tropo here one night and I picked up some really long-distance UHF TV stations, and some VHF stuff clear from 250 miles. I couldn't identify much of the UHF stations, so I'm wondering if anyone knows of any stations in Eastern North Dakota, the northern half of Minnesota or northeastern South Dakota as well as North-Western Ontario. I've identified the following stations:
29 CBWT-R Piney, MB
44 CICA-R Kenora, ONT
I also know of KVRR Channel 15 in Fargo, Channel 19 in Ellendale, ND and channel 42 in Alexandria, MN, but I didn't get those stations.

I received most of the stations in the range 21-31 and 41-49, but any station info, particularly on Home Shopping Afilliates, or stations that turn to home shopping at midnight would be appreciated.

>no longer works and if so what can I do?

Yep. What to do:
1) Continue to listen to images in the 900mhz range
as you are currently doing
2) Get a 800-900mhz to 400-500mhz converter (ex. from
Ramsey electronics)
3) Return/sell the PRO 51 and get a PRO 43 :).

** Would opt for #3, handhelds are nice, can be modified for cell, and
triple conversion gets rid of images.

I have uploaded to SimTel, the Coast to Coast Software Repository (tm),
(available by anonymous ftp from the primary mirror site OAK.Oakland.Edu
and its mirrors):

ftp://oak.oakland.edu/SimTel/msdos/hamradio/fftscan1.zip

SimTel/msdos/hamradio/
fftscan1.zip Audio spectrum analysis, scanner management

FFTscan version 1.0 is a msdos based program that runs in a 80x50
character VGA text screen. The top portion of the screen has a window
that shows the real time audio spectrum of the scanner output. The audio
is sampled with a required Soundblaster or compatible sound card. The
bottom half of the screen is a scrollable window that acts as a scanner
channel database. The database has options to keep track of Channel
Number, Frequency, Delay status, Lock out status, and a Comment. The
database can be sorted based on channel number, frequency, or comment.
The end result is a useful control panel that contains all your scanner
information, along with a colorful real-time frequency plot of the audio
your radio is receiving.

Special requirements:
VGA display adapter
Microsoft compatible mouse
386 or higher CPU
Math Coprocessor
Soundblaster or compatible sound card

ShareWare. Uploaded by the author.

From: fsw9724@vaxb.isc.rit.edu
Message-ID: <1995Mar30.030305.3528@ultb.isc.rit.edu>
Source record: 259253

Question for the EMS people here...

Any truth to the rumor that the FCC wants all dispatching of ambulances
OFF med ten (462.975)?

I heard a rumor this was true-the FCC just wants amb-hospital reports
etc on this channel.

Boston*EMS uses Med 10 for their primary dispatch, but for the past
year they have been using another channel and simulcasting (WNZF-351)
and the explanation was that they were supposed to get off MED 10..
But they are still there now...So I just wanted to know what was up..

Thanks...

Scott

Mike:

I have never had a problem with them. I have dealt with them a couple of times. Users on Compuserve have used them and haven't had any problems either.

The only problem now is that THEY ARE GONE! Yep. RS has purchased their franchise back. Who knows...maybe RS liked the way they were moving equipment and wanted a bigger piece of it so they bought them out. Anyway, they are no longer around. Since something like that takes a some time to do, the people at MaryMac decided to stop purchasing since they knew they were going to shut the doors.

This is all quite true, however a RS manager told me that they reserve the right to "repair or replace" equipment brought in to them for repair work (while under their warranty period anyways). When I asked what they'd do in the case of a 2006, which is no longer available, he said they'd replace it with a "comparable" current model scanner. I believe *their* definition of "comparable" would then apply, unfortunately....

<Michael_Cole@hp6650.desk.hp.com> writes:

Regarding NiCad life:

1. Shallower cycles will extend the cycle life. Typical cycle life
is 300-400 deep cycles. Discharges to 80% capacity remaining
can increase it by 2 to 3 times. Remember that there are other
issues involved with battery life than just cycles. Discharge
rates, charge rates, temperature and plain old time take their
toll also.

2. Full discharge on every cycle is NOT necessary to solve problems
of "Memory" or temporary loss of capacity. It's ok to do, but
you will get minimum cycle life out of your battery. I'd
suggest 1 full cycle in every ten to help excersize the battery.
This can be diffucult to administer and is not an exact figure
by any means.

3. "Memory Eraser" or refresh type chargers often fully cycle
(discharge prior to recharge) the battery every time they
charge. Again, this is OK, but this will reduce cycle life.
These chargers have become popular for camcorders and cell
phones.

Everyone has an opinion on batteries, and most of us are wrong :)
As with humans, age takes it's toll on batteries and the best kept ones
still fail due to aging.

This is very true with Lead Acid /SLA (gell-cells), but less so with Nicads.
Shallow and deep cycles are not terms associated with NiCads. Depth of
Discharge (DOD) is not a spec used with nicads in determining useful life.
As long as the battery isn't taken so low that the cell reverses, it is ok to
take it to 100% discharge without reducing the lifespan of the battery.

>best to manage Ni-Cads?

Care of Nicads is very different from care of lead acid batteries. In some cases, the care of lead acid batteries is exactly opposite that of Nicads. Generally, lead acid or sealed lead acid (aka SLA) (also known as Gel-Cells, which technically is not an accurate description, since this was a "trade" name the Globe Batteries used for their SLA batteries), will last a long time if the batteries are not discharged too deeply. They can also be floated with a charge indefinitely since SLA batteris will only draw the charge they need. This makes them great for backup power. Their relatively low price makes them the main workhorse of the battery industry. There are much better technologies out there (like Chloride batteries), but their high price makes them rare in non-commercial applications.

Nicads can be discharged all the way without damage to the battery. They should not be left floating on the charger for long periods of time. While SLA batteries use a constand voltage source for charging, Nicads require a constant current source. Slow charging is better for the batteries than fast charging (I usually use the 60-80mA chargers for AA batteries). Repeated use is not a problem - there is no need to let them "rest", but if you are using a slow charger, then charging could take 12-20 hours, so an extra set of batteries is a good idea.

While there is scientific theory and proof of the memory effect, it is not something that you have to worry about. Most nicads are killed by overcharging, not memory effect. Others are killed by dendrites or voltage reversal. A nicad battery should be stored in a discharged state (1v. per cell). This will avoid dendrites. Voltage reversal can be avoided by not over discharging a battery pack, but if the batteries in the pack are mismatched, cell reversal may be unavoidable - thats why it is not advisable to buy cheap battery packs (or Radio Shack nicads in some cases).

If you need more info on SLA or Nicad care I can post some of the info I've collected.

In Sailing magazine this month, they have a detailed article on battery usage for yachts. They give some advice for lead-acid battery management that is counter to the conventional wisdom for boats with dual batteries. This advice also runs counter to conventional wisdom for using Ni-Cad batteries. I would like to know if some of the experts reading this group might tell me if the following is relevant to using Ni-Cads in handheld radios.

In boats it is common to have two batteries that alternate in service, one being discharged deeply while the other one charges and "rests". The author contends that this results in shorter battery life because the life of a battery is extended significantly if it is discharged a smaller percentage each time before it is recharged. They suggest using both batteries at the same time thereby discharging each one less.

The question that comes up is, "Does this apply to Ni-Cad batteries as well?". I have been told to discharge my Ni-Cads almost completely before recharging to avoid the dreaded "memory effect". However, I don't want to shorten the battery life unnecessarily. Any advice on how best to manage Ni-Cads?

Thanks,

Michael

Don't seem to have the original of this thread.

The BJ was basically a 16 Channel scanner. AM/FM on any frequency.
Coverage went something like (without checking) 66-88, 108-174 220-260,
380-512 however the CPU would accept frequencies outside the designed
limits. Performance was however reduced in these out of band parts.

Power was an internal Nicad Pack. The Radio was also available as the
"Challenger".

A BJ MkIV was advertised with similar coverage but powered from 4 x AA
cells as appears to becoming the norm. I don't think it ever made it.

Hi Jon,

I'm afraid your a little of the mark. As a member of the public in the
UK The Wireless Telegraphy Act 1949 does not allow you to receive
anything other than authorised Broadcast stations, Amateur Radio and
CB transmissions together with weather or navigation information WHEN AT sea.

The UK does not have any restrictions on the frequency coverage
of scanners or any legality on owning any "scanner" providing it is not
capable of transmitting.

The listening to Aircraft (VHF/UHF) is just as illegal in the UK as
listening to the Police, Fire, Ambulance, Cellular etc etc.

Over the years many people have assumed "its OK to listen as long as you
don't tell". This may have developed from when it was possible some
years ago to receive the Police on domestic FM radios I'm not sure.

There have been one or two cases that have made it to the press where the
owners of scanning equipment have ended up in court - it is safe to say
though that in every instance that was alot more to the "story" than
just listening or divulging what you heard. Having a Police frequncy
in a memory channel (even if your set if turned off) is now sufficent
for the Police to take some course of action although as above unless
you happened to have a criminal record as long as your arm and were sat
outside a bank at 2.00 in the morning with a face mask on I doubt very
much you would end up in much trouble nevertheless though.....

I had elderly one customer recently who unfortunatly had his Scanner
monitoring Police frequencies when they called during some routine
house to house enquiries - on hearing there own "control" coming
from one of his rooms they took his scanner from him but later returned
it albeight after clearing all the memory channels - I can't vouch for

how true this is only thats what he told me.

There have also been press stories of Police "stings" where transmissions were made regarding such things as Landing UFO's, the result being those who turned up were rrested. I do not know of anybody who got caught in this nor have I ever spoken to anybody who has had first hand knowldge of such things so I still treat these stories with a considerable wide bearth.

Airband listening is a very popular part of the "scene" here in the UK- visit any airfield civil or military especially somewhere like Heathrow or Mildenhall/Lakenheath and you will see an array of mag mount antennas that would do any GCHQ site proud.

So to answer your question it is Illegal to listen to car phones/cellular in the UK. I should think though I stand more chance of winning this Saturdays National Lottery of GBP19M than I would getting into trouble if I listened to cellular !

The Radio Communictions Agency produce a A4 information sheet on the use of scanners (Form RA169, phone number +(0)171 215 2150). The reverse side of which has the following "Questions and answers":-

Is a licence needed to own a scanner ?
Not if is inherently incapable of tranmissions. But its use to listen in to private messages is an offence.

Does owning a scanner make a person liable to prosecution ?
No, but is use, except as permitted under section 5(b) of the Wireless Telepgrphy Act would.

Is it all right to listen as long as what is overheard is not disclosed ?
No, using radio equipment to listen in, except as provided for by Section 5(b) is an offence, regardless of whether the information is passed on.

Could I get "authority" from the Secretary Of State to listen to the emergency and martime and aeronatical services. I am interested in them and wish to help ?
No, the Secretary oOf State's authority is usually reserved for persons acting at his request and on his behalf. If you wish to listen in to messages, you must obtain permission of the person sending them.

Isn't this a bit heavy handed ?
No, no one likes their private conversations to be listened in to. Parliament has passed the laws in question to protect the privacy of radio users.

Sorry for being so long winded but you did ask :-)

All the best.

Ne> every alarm had a permit in effect and that's a lot of guns -
Ne> for up tight New York. So which is it? Or is there a simple
Ne> explanation I've missed.

I work for the NCPD as a paramedic. Yes, in Nassau County a permit is
required for both residential and commercial alarms. It was put in to
effect because there is quite an abuse of the system. Basically, u can
get a summons for 2 things..... unregistered alarms, and chronic false
alarms.. After so many they even have the power to cut your alarm telco
lines in some cases. I think the alarm installers need licences too

Hope that helps

P.S.. by the way, all I remember about NCPD is when there were around
30 MHz!

Other than comsetic appearance frequency coverage. The '43 has 220-400
Military air - the '51 does not. The '43 is AM/FM capable on any
frequency the '51 doesn't.

> Is the Pro-43 an older model of the Pro-51?
Its an "older" radio but not really of the '51 (It is due to be replaced
by the PRO-60 at some point in the futuure)

> Is the Pro-43 still current production?
MMmmm.....don't know to be honest, but maybe. You will find it ever
harder to find one in the USA but they are planned to remain avaialble
in Europe until the end of 1995 when they will be discontinued after the
PRO-60 is out.

> What can the 51 do that the 43 can't or vice versa?
Its more a case of what the '51 does not do over the 43 I'm afraid. If
you are into Railroad scanning you may find the '51 a better bet - less
problems with interfence at the required frequencies.

Hi Jerry,

This does not really effect the USA but I can assure you that there are
PRO-43's with 10A4 date codes on that are modifiable...just not in the
USA :-(

I don't know for sure but I beleive that the Date code labels are
"stuck" when they are despatched to the main RS wharehouse from GRE
rather than the actual date of manufacture. This is only guess work
though and I could be completey wrong !

Hi John,

'Fraid not. I assume its the same for the Trident TR-4500
which I beleive is the same. (You couldn't either on the AR2515 which
came before the '2500 and was a modified AR2002).

All the best.

Can someone tell me what the difference is between the Pro-43 and Pro-51
radio shack scanners.
Is the Pro-43 an older model of the Pro-51?
Is the Pro-43 still current production?
What can the 51 do that the 43 can't or vice versa?

: > Definitely use the discone! But put it in your attic to prevent lightning
: > strikes. Besides, it's more attractive in the attic and who wants to climb
: > on their roof.

: Putting an antenna in the attic will not *prevent* lightning strikes,
: only (greatly) reduce their likelihood. A wood roof with a nice
: ground plane in it could be the 'easiest' path.

: Even w/o a direct hit, inductive voltages could be enough to fry
: something...

I have an ICOM Discone 7000 antenna mounted 25' above my roof. I have a PRO 2006,
Pro 2024 and a PRO 37 all hooked up to this same antenna for the 3 1/2 years.
I have never heard of any unusal attraction to lightning and I have
several friends who also have this same antenna on their roofs.

I live in Dallas on a hill and we have had some hellatious electrial
storms around here with nothing hit except trees.

I could only drive my copper rod 4' into he ground and I use a large
copper wire from the antenna to the rod.

Either I am doing something right or the idea that this type of antenna
is a lightening rod is not accurate.

Don in Dallas

Hi Martin,

I just got a Radio Shack Pro 2030, but you won't be able to get that in sweden. There is a radio by Sony which looks like a walkie-talkie which covers SW and VHF/UHF. I've never seen it in person, but if it's a Sony, it's probably good. I think it's in the Passport to World Band Radio. It may be discontinued, but you might still be able to find one somewhere.

I was scanning today in the area of 450Mhz today and picked up 3 or 4 different transmissions from DC. I am wondering why they came in so good. I was more than an hour away. Does anyone have an opinion on this? I was in a place that is quite high. There are a lot of antenna towers in this area. I picked up DC police, DC CAb Co., a remote TV crew, and a traffic reporter in a helicopter. I have never heard signals from DC from home. I live in an area that is also pretty high up and not as far from DC as I was today. Not sure if it has something to do with the elevation or if it has something to do with all the antennas in the area.

Mike,

I don't understand your concern. But, in any event, all mail received
that is intended for specific editors or columnists is delivered to the
intended party in the same fashion that it arrives in. I make NO changes
to anything sent to the attention of a specific editor or writer (or
another of our departments, such as circulation or advertising).

If the e-mail received doesn't tell me who it is intended for, I use my
best judgment depending on the content and see that it goes to one of our
editors or columnists.

If there has been a problem, I am not aware of it, and I'd appreciate you
telling me about it.

Plus, a big spikey ariel on the roof might look a BIT suspicious...

I've got a couple of discone questions: are the desktop 'baby' discones
any good? And what sort of gain (if any) does a discone give over a
suitably cut dipole?

And what about log periodics? I haven't had much experience of aerials at
all, except the extendible my scanner came with and a long wire shortwave
one I made. (this gives such strong signals I need the ATT switch!)

Source record: 259183

To repost the MED 10 question...Boston*EMS is using Med 10 (tac 10 for
those from the great city) as always for their primary dispatch, and
about a year ago they started simulcasting on 453.775 PL 156.7.
The reason I got (Unofficial) was that the FCC wanted everyone who
was using a med channel for DISPATCH to use another frequency...
Anyone else heard this? Boston currently transmits on 10, and
simulcasts STILL...However, as I am in school out here in hickville
Rochester, NY I really don't what is going on in Boston.

Since Hillary isn't the Vice President and Al Gore is and Air Force 2 is only caleed Air Force 2 when the Vice President is on board. I'd say that the comedians here lose. It's hard to talk about things you don't know about but I guess thats part of the beauty of the net.

I suppose deductive reasoning is beyond the limits of some and reading about federal communications is too. Air Force 1 is only called Air Force 1 when the president is on board and Air Force 2 only when the V.P. is on board otherwise they are SAM missions (Special Air Mission)...If you try real hard and actually listen to motorcades on the local police frequencies you'll here Sundance (Gore) or Eagle(Clinton) mentioned shortly after hearing Air Force 1 or 2 landing. This would be a sure bet that you aren't listening to Hillary or Ethyl Kennedy, since neither would be on Air Force Two without the V.P. being there.

Magazines such as Monitoring Times and Popular Communications are often great reading for the those who are willing to learn. They are also a great benefit of the hobby, listeners sharing with others who have open enough minds to absorb what they read.

4318. BC200XLT Problems - Help

Newsgroup: rec.radio.scanner
Date: 1995-03-31 00:00:00 UTC
From: Meg Alison Papa <mv0t+@andrew.cmu.edu>
Message-ID: <ojT9Wm_00WB=Iogtcc@andrew.cmu.edu>
Source record: 259192

I have a BC200XLT scanner and it is behaving strangely. When I turn it on (under battery or charger power), the lcd screen is blank and the speaker click at approximately the scan rate for a short time and then it makes a louder click and comes on normally, although the memory is frequently nuked. Sometimes it just clicks and doesn't come on normally at all. It seems to not come on at all more under charger power than just battery power.

Any suggestions?

Thanks

-Brian

4319. AR8000 LOVE IT, but some warts...

Newsgroup: rec.radio.scanner
Date: 1995-03-31 00:00:00 UTC
From: mike@shien.ist.csuohio.edu
Message-ID: <1995Mar31.182543.8954@news.csuohio.edu>
Source record: 259193

As wonderful as the AR8000 is in almost all respects, it does have a few warts. This is true for ANYTHING you buy. A banana gets bruised easily. It took forever to get Mercedes to install cup holders. So, here are some things I found odd about the AR8000. Not much we can do about most of them, but it was cathartic for me to list them here nonetheless. In my opinion, these warts pale in comparison to all the nifty things this radio can do. Don't get me wrong, I really love the radio; AOR has taken a real leap forward compared to most other scanner manufacturers. It's just that I'm anal retentive enough to gleefully enjoy picking out every nook and cranny of this radio. I also have responded to most of them in the AR8000's defense. Call it post-purchase rationalization. I think most owners have stumbled upon most of these. Notice none of these involve the computer interface, since I do not have one.

- Cheap feeling case compared to even lower priced HT's (Yaesu, Kenwood, Icom, etc).

Point: Yes, for the price, should be beefier, more solid.

Counterpoint: Makes the unit lighter. To make it beefier like HT's and professional gear (i.e., Motorola) would have driven the cost even higher. And, as one poster put it, would be "like carrying a small revolver". Also, an HT generally need the metal as a heat sink for the transmitter finals, which are not an issue with a scanner.

- Low viewing angle on LCD.

Point: Yes, needs to be wider. Tough, almost impossible to read at weird angle. Is there an internal contrast adjustment?

Counterpoint: It may be more expensive to manufacture a sophisticated 4-line alphanumeric LCD with a wider view angle, thus driving up the price. I have discovered that outdoors, in daylight, the display is easier to see off-angle.

- Loose dial/volume/squelch knobs.

Point: The rubberized knobs seem loose on the metal axles of the controls. Can be pulled off with not too much trouble, although tight enough not to fall off. AOR should have had hard knobs with set-screws, with rubber wrapping on the outside.

Counterpoint: Knobs are one piece, made entirely of the soft rubber, thus they will naturally move on the hard metal control shaft. Could probably find "hard" replacement knobs with set-screw if desired. The benefit of soft pliable knobs is that if the radio gets whacked or dropped on the knobs, the rubber knobs will give and not break, and also prevent damage to the internal controls beneath. Kind of a shock absorber. May be able to stuff something inside the knob holes to make them grab better. I wrapped a 3/4" by about 3/16" piece of electrical tape around the top portion of the metal shaft, with some of the tape projecting above the top of the shaft to allow me to "crimp" it down so the rubber knob would slide on smoothly. Seemed enough thickness to reduce the looseness you sometimes feel when rotating the knobs. They now feel a lot tighter.

- Knob position indicator dots needs more contrast.

Point: The rubber knobs have a light gray dot on medium gray rubber, which by and large is OK, but in low lighting or in shadows it's tough at a glance to see where the squelch/vol knobs are set. When you are looking directly at the front of the radio, you cannot see what position the volume and squelch are in. Most important if wearing headphones.

Counterpoint: Replace knobs with ones that are more visible. Or, take a thin permanent marker and carefully draw a black line across half the top of the knob (i.e, it's radius), crossing over the existing gray dot, and then all the way down the side of the knob. Could also use a thin red marker. This will make the knob position more visible. I did a similar thing with my old scanner which had black knobs with just a notched slit in the black plastic to indicate the position. Almost impossible to see where the knob was. I filled in the notch with white latex paint using a small sewing needle. Worked great. I did this on my AR8000, using flat latex paint, and it worked. Except that I filled between the two knob-ribs that were on the diametrically OPPOSITE side of the knob from the gray dot on top. That way, the white paint line is VISIBLE (i.e., facing you) when you hold the scanner when squelch and volume are both halfway up (a common setting). With out my white painted lines, I had to keep tipping the scanner to look at the dots on the top of the knobs to see what position the squelch and volume knobs were inn. You might have to carefully scrape away any dried paint from the knob where you painted to have it looks crisp (instead of it looking like you just gobbed some paint on the rubber knob grips). I used flat white ceiling latex. So far, it is sticking OK. I found that white gloss spray paint dabbed on with a toothpick or needle tended to flake off when it dried. I suppose you could also go as far as supergluing a short piece of white sewing thread between two of the rubber knurls.

In any case, I can now see much more easily where the knobs are positioned.

- Constant low-level speaker hiss, regardless of volume or squelch.

Point: Will nominally soak up a little more battery power than if the thing were silent. Most noticeable with headsets or earphone.

Counterpoint: Not noticeable in normal, non-headset use, although it's there. I usually have problems with headphone/earphone connections, whether it be trouble with the wire, connector, or earpiece. I have gone stretches of time listening to nothing on a scanner only to find that the earphone or headset had something wrong with it. Had no way of knowing that no audio was making it from the scanner jack to my ears. A low-level of audio hiss while not locked onto a channel during scanning lets you know the headphone/earphone is connected and working OK. Use the hiss as a reminder that the unit is on if it's stuffed in a pocket and you are using a headset or earphone. One poster recommended putting a 1k to 2k resistor in series with your earphone (via a splice in your headphone/earphone wire). Since the "hiss" level is constant regardless of the volume setting, it reduces the audio's signal/noise ratio when you turn the volume up to compensate for the resistor suppressing the hiss. Slick idea.

- Can't set scan delay per-channel

Point: Delay is set to all channels or none, although it is variable between 0-10 seconds.

Counterpoint: Initially I was disturbed by this until I came to the realization the on my old scanner, after using it for 3 years, I had set delay only to ONE channel. The solution is to make that one channel on the AR8000 the priority channel, or, just live with NO delay at all. I have found that a 1.5 second delay for all channels (default is 2 sec), with NO priority, is optimal for my uses. Still wish it had it though.

- Scanning speeds seem to be different, per bank.

Point: The scanner scans at different speeds depending on the arrangement of frequencies and modes in a given bank. The scanner will scan a bank faster if similar frequencies and modes are grouped together contiguously within that bank. The manual only mentions this fact AFTER you have put all your frequencies into the radio! Apparently, if you have a bank with wildly differing frequencies and modes as you progress sequentially from channel to channel it consumes more scanning time because the VFO has to swing back and forth between frequency settings if you just enter them randomly. It also

takes time for the CPU to set the different modes as it scans. I think the scanning logic in the radio could be improved such that it pre-sorts the frequencies, in order, while scanning. Some of the Uniden scanners do this pre-sorting. So to get the OPTIMAL speed out of the scanner, I went back and re-ordered the frequencies within each bank so that the first frequency (for example, A00) is the lowest and the last frequency (for example A36) is highest, with everything in between in ascending order based on the frequency. For example, prior to re-shuffling my "A" bank, I was getting about 13 channels per second. After sorting them in ascending frequency value, I clocked the same bank at about 16 channels per second. This is because of the frequency ordering - the VFO is not having to traverse as much frequency "space" between subsequent channels, since the are now in order. This to me is a drawback of the radio.

AOR should have worked this out by perhaps providing a frequency "sort" feature in addition to the existing copy, move, and swap. So, once you put all your frequencies into the desired bank, in whatever order you want, you simply would hit the "sort" option, and it would re-order the frequencies in the bank for optimal scanning speed. I figured out a way using the swap feature in a particular bank and a pencil and paper to relatively easily re-order a bank without having to enter any new frequencies. I won't go into my method here, but if anyone is interested in how I did it, let me know. It's methodical, but after a couple of passes, it magically sorts a bank of randomly entered frequencies into ascending order. If you have the computer interface, then that is probably a better way of doing it.

My Radio Shack PRO-37 scans at a constant rate of 25 channels per second regardless of the frequency transitions. The closest I ever got to the advertised rate of "30 channels per second max" was when scanning through the 40 AM CB channels. I got just over 27 channels per second, and that was with the PLL LOCK set at 0 milliseconds.

With a stopwatch, I clocked a few of my programmed scan banks (with antenna off and squelch all the way up so there were no interruptions), before I reordered them:

40 CB channels (AM): 27 channels per second.
20 cordless frequencies (NFM): 17 channels per second.
23 mixed VHFlo, VHFhi, UHF freqs. (NFM): 13 ch. per sec.
(after reordering this one, it jumped to about 16 cps)

It seems that not only is scan rate dependent on the various lock parameters (PLL and SQUELCH), but also dependent on what the VFO is actually having to do as it scans a given bank. The 40 CB channels scanned real fast, but the scanning is

always in AM, and the frequencies are ordered low to high, are relatively close together. The slowest scanning was where I had frequencies that jumped all over the place, from 38.350, to 151.385, to 423.275, in NFM. I would hope AOR would someday come up with an upgrade that would give a consistent scan rate. The "max 30 channels per second" that you see in the documentation is perhaps a little misleading, (the closest I got was 27), and generally not usually the case. If you dial-down the squelch lock to get closer to the 30 channels per second scan rate, you will wind up missing live channels. At least my PRO-37 with HyperScan clips along at a constant and predictable 25 channels per second. Oh well.

- Bassy audio

Point: Would like ability to adjust audio "tone" (i.e., crude bass/treble or variable hi/lo adjustment). Perhaps as a pot on a circuitboard, accessible from battery compartment.

Counterpoint: I much prefer a fuller, bassier sound compared to the really tinny PRO-37 I have. Also makes WFM audio sound surprisingly decent. Seems to help on shortwave too.

- Easy to delete channels.

Point: You can accidentally delete a channel by doing [FUNCT][9] if you happen to be on that channel. There should be an "Are You Sure?" message. It should be able to be disabled in EXPERT mode. This is not a problem with deleting a bank, since there is a sub-menu for it, and it's real tough to accidentally blow away a whole bank. Plus, when you delete a channel accidentally, there is nothing telling you what just happened. You will eventually notice it when you never hear that channel for a while.

- Dial has to play catch-up, display skips sometimes.

Point: Turning the dial when reviewing scan channel contents one channel at a time sometimes does not mesh exactly with what's on the display. It may sometimes be out of whack by one channel.

Counterpoint: Turn slower when approaching desired channel.

- Plastic LCD cover nearly flush with case.

Point: Being not recessed makes it vulnerable to scratching and scuffing.

Counterpoint: Get a carrying case with a clear plastic cover for the display portion. AOR sells one. Make a habit of NOT setting the unit face down.

- Priority channel requires that the scanner briefly go check the priority channel every few seconds to see if it is active.

Point: This causes an audio dropout when it goes to check the priority channel for activity. Seems to me that while scanning, the priority channel should be monitored independently (requiring a TRUE second VFO) and only interrupt normal scanning when it comes to life.

- Unit can fall backwards easily.

Point: If you look on the bottom, you will see four slightly raised feet that keep the unit stable when standing up. There are no feet on the bottom of the battery cover, thus, the radio will lean and fall backwards more easily when pushed, than it will if you were to lean it forward.

Counterpoint: I cut two narrow strips of electrical tape (about 1/8 x 1-1/2 inches) and put one on top of the other at the very bottom of the battery cover. The two tape thicknesses serve as a more rearward foot for the unit, and it now stands more stable. Also, the snug-fit case you get from AOR has more of a squarish bottom, and stands upright more readily.

- Metal belt clip clamps too tightly.

Counterpoint: Remove it, and slightly bend the metal tabs where the screws go. I set mine so that when installed, the clip barely touches the serial number sticker on the back. Easier to put on a belt or hang in a pocket.

- BNC antenna connector comes loose with a big antenna.

Point: With a longer antenna, somewhat more stress is put on the BNC connector.

Counterpoint: Probably OK to take apart and tighten. I have a bigger antenna that flops around a lot, but I have not yet had the antenna connector loosen up on me.

- Power Save only in VFO or 2VFO mode.

Point: The power saver feature ONLY works in either the 2VFO or VFO mode, when there is no signal present. The manual does not mention this, thus I assumed that power saver worked in the scan and search modes as well. I tested this by checking the current consumption in the various modes while power saver is on. The power saver drops the nominal current consumption from the 110-170ma range down to about 24ma, by cycling the receiver circuit on/off at a predetermined interval.

Counterpoint: If power save were to have been designed for use on scan and search modes, then it is possible that with the power cycle time and your scan rate, you could conceivably never have the receiver circuit on while it is scanning an

active channel. This would not happen much, but it could happen.

- Keypad labels wear off with lots of use.

Point: AOR botched it on this one. Should have had better ink, or perhaps made the letters part of the rubber rather than just painting them on each pad. Write or call and complain. Probably the most significant physical shortcoming of the radio.

Counterpoint: Get the case with the clear front. Works great, protects the unit, and keypad. Also, maybe there is some clear coating that is both compatible with the keypad rubber and the lettering paint that will seal or protect the printing? Latex or silicone based sealer?

- Dial tough to use when tuning manually on shortwave.

Point: The little dial, with it's click detents, makes it a little clumsy when trying to tune around the shortwave bands. Perhaps AOR should consider having a little button near the dial that releases the clicker so that the dial turns smoothly, like you would expect on a regular shortwave radio.

Counterpoint: I personally like the click detents, rather than a smooth turning knob. The clicking is almost a requirement when finely tuning frequencies one step at a time, and also for dialing in alphanumeric text information. I use AUTO SEARCH in conjunction with the dial knob to easily zip through the shortwave frequencies. The manual says not to use squelch, but I do - it seems useful.

- Battery terminal pulled out when I removed the batteries.

Point: When looking down at the battery compartment, the upper right battery contact will slide out of it's slot completely if you remove the rightmost battery by pulling it out from the top. Seems that the battery terminals make contact with a circuitboard behind, inside via a socket of some sort.

Counterpoint: Be careful when removing the batteries.

- Supplied antenna has the sensitivity of a carrot.

Point: The supplied duck antenna is nice and compact, and does not look bad, but it has so-so reception.

Counterpoint: I suppose in a radio-laden urban area, a less sensitive antenna might be desirable to cut down on intermod and images. Other than that, get a better duck. I got the Diamond 8-band antenna, which also happens to transmit on 2m and 70cm ham. Picks up a lot better than the supplied one. The model number is RH77** (forgot the last two characters).

It's about 14" long. About 32 dollars, but you are getting
what you pay for.

One final thing that happened to me only a few times, and seemingly
never again, was that when I turned the radio on, the 2VFO mode
would display the 80MHz frequencies, and the lamp would go on for
5 seconds, as if it had reset itself when I turned it on. I may
have accidentally held the "CLEAR" button, but it did it when it
was resting on it's back on a table!. Once or twice, when I turned
it on, the 80MHz frequencies would come up, but, it did not do an
ENTIRE reset (as it would if I HAD held the CLEAR button down),
since it was still in EXPERT mode, my pass channels were still
there, my SEL SCAN channels were still there, etc. These things
all reset when you turn the radio on with CLEAR pressed. Strange
fluke, but it has not done it since.

I really scared myself once - I got the bright idea to tune the
scanner to the clock frequency of my 486 PC (25MHz) to see if I
could hear anything. I got the antenna too close to the CRT and
got a static snap to the antenna from the screen! Suddenly, the
radio would only produce a quiet hiss after that. I almost filled
my pants. During my cold sweat, I turned the radio off for 10
seconds, then back on again. Everything was fine! I can only
imagine that AOR put some sort of surge protection on the front end
of this radio that keeps most dangerous spikes away from the rest
of the radio. Boy was I lucky. Thanks AOR.

I don't have the nerve yet to take the radio apart to see what
makes it tick, however, I understand that it is plug-in modular for
ease of repair (I have heard the only wires are from the
circuitboard to the speaker). Perhaps though, as the electronic
warts are worked out, it will be possible to purchase plug-in
upgrade modules from AOR which would improve things like the scan
speed. Perhaps they will come out with EEPROM upgrades to include
more features (like bank channel re-sort, or entire-bank copy).

My 2 cents worth on the "darker side" of this terrific radio.

Would not trade it for anything.

Bill, just FYI; Two man radar has been used in Ontario, mostly by the
provinacial force for a few years now. Quite often an "Evil Kinevil "
will sit on a bridge/overpass and just radio ahead to a marked car. My
friend got burned like this for doing about 80mph in a 60 zone. You are
absolutely right regarding reason to believe, often phrased reasonable
grounds.
Talk to ya!

Try the antenna jack. The prongs that touch the antenna connect may be
making poor contact. After that try the cinnector on the inside of the
radio, perhaps a poor solder joint.

Anyone one out there know of a great mast-mounted pre-amp for coverage between 50-1300 mhz.

>I thought that the 400 memory Scout was called the Scout 40(?). If not,
>then what's the difference between the two?

Optoelectronics began advertising it as the Scout 25; with 50, then
later 100, then finally 200 memories. When they realized that they
had to charge more for the enhanced memory, they changed the name to
the "Scout 40".

My unit says 25, but has 400 memories. Supposedly some units shipped
with only 50, but I heard that OEI will upgrade those owners for free.

This was a fear of mine when my PRO-43 died (fell off my desk
at work and mangled the power jack). I sent it off earlier this
month to Grove for repair instead. It's not under warranty anymore
so, RS was definately my "last option".

BV> out of sight should you be pulled over.

Go to court and ask the officer what?
Could I get off? Probably. Could *YOU* get off? I dunno. Do you know enough
law to question the officer(s) in a way that shows the judge you aren't
wasting everybody's time?
If the officer who observed the alleged infraction isn't there, the one who
IS there had better be able to give more evidence than "Officer So-and-So
told me the defendant was speeding." That's useless, *IF* I know enough to
say so.
I spent a lot of effort to learn how traffic radar works. I got the tech &
user manuals from Kustom to fight two tickets I got using radar. Also the
sylabus the departments got from Kustom that are supposed to be used in
training the officers to use the radar units properly (it wasn't). One of
the officers (from San Francisco) didn't know the difference between a
nautical and a statute mile, didn't know how the radar unit arrived at the
figure it showed, had no idea of what the "best" target was, as opposed to
the "intended" target. He was lucky he knew which end to point at his
target. The Santa Rosa officer was simply shooting every vehicle to come
over a rise. I argued that this was an illegal search, and that the radar
unit was being used by the officer as the sole evidence of an infraction.
This is illegal because the radar unit cannot be cross-examined.
(traffic radar is supposed to be used as a tool, to verify the speed
of a target vehicle suspected of speeding. Using the radar as the
determinator of who is speeding is illegal. Otherwise, it is
considered to be simply searching everyone, to determine who is
breaking the law, with no reasonable suspicion that ANYONE is.)
Am I a lawyer? No. No one has to be a lawyer to know the law.
Nothing I am saying here should be construed as legal advice.
My advice to everyone is this: go and learn as much as you can. About

everything.

I've got exactly the program you've described. It's called SoundEffects 0.9.1
Here's the contact info for the $15 shareware program:

SoundEffects 0.9.1
Alberto Ricci
Corso De Gasperi, 45
10129 Torino Italy
e-mail: ricci@pmn.it
or fricci@polito.it

This is a Macintosh program though.

>

The best way to manage Ni-Cads is to not overcharge them. In any
normal use, memory is a myth. If you repeatedly discharge and charge
them between precisely the same points you can develop the "memory"
effect, which is really a voltage depression of .1 or .2 volts per
cell. If the load is sensitive to the battery voltage it may
interpret the voltage depression as "battery almost discharged" and
shut down. This effect has been noted in spacecraft with
sophisticated charge circuits which can cycle the battery precisely
enough.

What happens with earthbound Ni-Cads is overcharging, which overheats
the cells, causing outgassing, loss of electrolyte and thus capacity,
and other degradations. So charge your Ni-Cads whenever you want to
be sure they're topped off, and either use a smart charger which can
tell when they're fully charged, or charge them at the 14-16 hr rate,
at which a moderate amount of overcharge won't hurt anything. What's
moderate? Hard to give a specific value. When I slow-charge, I
assume the battery was dead and give it the full 14-16 hrs. If it
wasn't dead, it doesn't get more than probably 6 or 8 hours of
overcharge. That's not going to hurt anything. I certainly wouldn't

leave one on for days at a time, however.
